1 Sacramento, California; Tuesday, October 19, 2004

2 6:31 p.m.

3

4 MR. DUKE: First I'd like to welcome --

5 UNIDENTIFIED SPEAKER: We can't hear you.

6 MR. DUKE: Can you hear me now?

7 UNIDENTIFIED SPEAKER: Move it up a little bit.

8 MR. DUKE: Again, I would like to welcome each and
9 every one of you to tonight's public hearing for the
10 Missile Defense Agency Ballistic Missile Defense System
11 Environmental Impact Statement.

12 This public hearing is being held in accordance with
13 the NEPA Environmental Policy Act -- excuse me -- the
14 National Environmental Policy Act or NEPA.

15 My name is Marty Duke. I am the Missile Defense
16 Agency's Program Manager for the development of the
17 Programmatic Environmental Impact Statement.

18 I would like to introduce Colonel Mark Graham, who is
19 with the Missile Defense Agency's Office of General
20 Counsel. Colonel Graham will talk about the Draft
21 Programmatic Environmental Impact Statement, the NEPA
22 process and the Ballistic Missile Defense capabilities and
23 components.

24 I also would like to introduce Mr. Peter Bonner,
25 Ms. Deb Shaver in the back, who is with ICF Consulting.

1 Ms. Shaver is the ICF Consulting Program Manager and the
2 technical lead for PEIS.

3 Mr. Bonner --

4 UNIDENTIFIED SPEAKER: What is ICF, please?

5 MR. DUKE: ICF is -- letters. It does not represent
6 a name. It's ICF Consulting. It is the name of the
7 company they work with.

8 UNIDENTIFIED SPEAKER: ECF?

9 MR. DUKE: ICF.

10 UNIDENTIFIED SPEAKER: UCF?

11 UNIDENTIFIED SPEAKER: We're going to give you a hard
12 time.

13 MR. DUKE: That is fine. That is why we're here, to
14 listen to you provide your comments.

15 With that, I'd like to turn the meeting over to
16 Mr. Bonner, who will go over tonight's agenda and discuss
17 some administrative points on how to provide the public
18 comments on the Programmatic EIS.

19 MR. BONNER: Good evening. I'd also like to welcome
20 you to the public hearing. We're from DC so we have to
21 have some acronyms for tonight's meeting. We'll refer to
22 the Missile Defense Agency as MDA during this
23 presentation.

24 We'll review the Ballistic Missile Defense System or
25 BMDS. We'll discuss the Programmatic Environmental Impact

1 Statement as a PEIS.

2 Therefore, at tonight's hearing, we'll discuss the
3 development of MDA's draft BMDS PEIS. There is a test at
4 the end.

5 Next we'll discuss the proposed action, which is the
6 implementation of an integrated BMDS, the activities
7 involved in implementing the BMDS, which have been analyzed
8 for the potential environmental impact. Finally, we'll
9 provide a forum to collect your public comments on the
10 Draft PEIS.

11 It's our goal to have an open informative process
12 tonight. To ensure MDA has enough time to receive your
13 oral comments, we'll use the following agenda for
14 tonight's meeting: We'll spend -- the first portion is a
15 30 to 40 minute presentation with information about BMDS,
16 the NEPA process, the National Environmental Policy Act
17 and our analysis.

18 The presentation will discuss: What is a
19 Programmatic EIS? What is the BMDS? How were potential
20 impacts analyzed? What were the results of the analysis?
21 And how to submit comments on the Draft PEIS.

22 We'll then take a 15-minute break where you'll get a
23 chance to sign up at the registration table, if you
24 haven't already, to provide some of your oral comments.
25 After the break each speaker will be called in the order

1 they've signed up to come and make their statements.

2 Following the public statements MDA representatives
3 will be available at the poster area to help clarify any
4 information you might need.

5 Please note the questions and comments provided in
6 the poster area will not be officially recorded. However,
7 all questions can be formally submitted today to MDA
8 through other available methods.

9 The most important aspect of tonight's meeting is to
10 hear your comments in the public comments portion. All
11 public statements provided tonight will be recorded in a
12 transcript.

13 Please remember that the Programmatic -- the PEIS is
14 a draft document. This is your opportunity to provide
15 comments on the document before it's finalized and before
16 a decision is made.

17 We're going to listen firsthand to your suggestions
18 and concerns. As you give your oral comments, please
19 limit your comments to three minutes. I think we've got
20 25 or 30 folks who want to make public comments.

21 The purpose of the meeting is to gather the comments.
22 We'll attempt to answer your questions, clarifying the
23 points we've made in the presentation out in the poster
24 area. Substantive questions recorded tonight will be
25 carefully considered in the Final PEIS.

1 If you wish to provide written comments, forms are
2 available at the registration table. You may leave the
3 written comments with us at the registration table. You
4 also have options to email, fax or voicemail your comments
5 to us.

6 To allow time to consider and respond to the comments
7 in the Final PEIS, we need to receive your
8 comments -- your comments must be received by November 17.

9 Colonel Graham will discuss the BMDS PEIS and the
10 NEPA process.

11 Thank you.

12 COLONEL GRAHAM: Thank you, Peter. Can you hear me
13 okay? Good.

14 NEPA establishes our broad national framework for
15 protecting the environment. NEPA requires Federal
16 agencies to consider the environmental impacts of proposed
17 actions and the reasonable alternatives of those actions
18 early in the decision-making process.

19 The NEPA process is intended to help public officials
20 make decisions based on the understanding of environmental
21 consequences and take action that protects, restores, and
22 enhances the environment.

23 In the past, the national approach to the missile
24 defense focused on the development of the individual
25 missile defense elements of programs such as the Patriot,

1 Airborne Laser and ground-based interceptors. These
2 actions were appropriately addressed in separate NEPA
3 analyses that MDA, its predecessor agencies, and
4 executing agents prepared for these systems.

5 The aim of missile defense has been refocused by the
6 Secretary of Defense to develop an integrated Ballistic
7 Missile Defense System that would be a layered system of
8 components working together, capable of defending against
9 all ranges of threat missiles in all flight phases.

10 Because the integrated Ballistic Missile Defense
11 System is a large program made up of many projects
12 implemented over time on a worldwide basis, MDA has
13 determined a programmatic NEPA analysis would be
14 appropriate.

15 Therefore, MDA has prepared a Programmatic EIS to
16 analyze the environmental impact of implementing the
17 proposed program.

18 The Programmatic EIS or PEIS analyzes the broad
19 environmental consequences in a wide-ranging Federal
20 program like the BMDS. A PEIS looks ahead at overall
21 issues in a proposed program and considers related actions
22 together in order to review the program comprehensively.

23 A PEIS is appropriate for projects that are broad
24 in scope, are implemented in phases and are widely
25 dispersed geographically. A PEIS creates a comprehensive

1 global analytical framework and supports subsequent
2 analysis of specific activities of specific locations.
3 The Programmatic EIS is thus intended to serve as a
4 tiering document for subsequent specific Ballistic Missile
5 Defense System analyses and includes a roadmap for
6 considering impacts in resource areas and developing
7 future documents.

8 This roadmap identifies how a specific resource area
9 can be analyzed and includes specifics for considering
10 the significance of environmental impacts on specific resource
11 areas. This means that ranges, installations, and
12 facilities at which specific programs may occur in the
13 future could tier their documents from the PEIS and have
14 some reference point from which to start their site-specific
15 analyses.

16 The Ballistic Missile Defense System Programmatic EIS
17 analyzes the potential impacts of developing, testing,
18 deploying and planning for decommissioning of the proposed
19 program.

20 The Programmatic EIS evaluates the proposed Ballistic
21 Missile Defense System's technology components, assets and
22 programs and considers future development and application
23 of new technology.

24 The proposed action considered in our Programmatic
25 EIS is for MDA to develop, test, deploy and plan for

1 decommissioning activities for an integrated Ballistic
2 Missile Defense System, using existing infrastructures and
3 capabilities, when feasible, as well as emerging and new
4 technologies to meet current and evolving threats.

5 When feasible, MDA will use existing infrastructure
6 to implement the BMDS and would incorporate new
7 technologies and capabilities as they become available.
8 This would ensure the program could provide defense for
9 both current and future missile threats.

10 The purpose of the proposed action is to
11 incrementally develop and deploy a Ballistic Missile
12 Defense System, the performance of which could be
13 improved over time, and that layers defenses to intercept
14 ballistic missiles of all ranges in all phases of flight.

15 The proposed action is needed to protect the United
16 States, its deployed forces, friends and allies from
17 ballistic missile threats.

18 In this Programmatic EIS, MDA considered two
19 alternative approaches to implementing the Ballistic Missile
20 Defense System in addition to the No Action Alternative.
21 The alternative approach is to address the use of weapons
22 for land, sea, air and space-based platforms.

23 Alternative 1 is to develop, test, deploy and plan
24 for decommissioning for an integrated Ballistic Missile
25 Defense System that includes land, sea and air-based

1 weapons platforms.

2 The BMDS envisioned in Alternative 1 would include
3 space-based sensors but would not include space-based
4 defensive weapons.

5 Alternative 2 is to test, deploy and plan -- develop,
6 test and deploy, and plan for decommissioning an integrated
7 Ballistic Missile Defense System that includes land, sea,
8 air and space-based weapons platform.

9 Alternative 2 would be identical to Alternative 1,
10 with the addition of the space-based defensive weapons.
11 The Counsel of Environmental Quality Regulations
12 implementing NEPA also requires consideration of the No
13 Action Alternative.

14 Under the No Action Alternative, the MDA would not
15 develop, test, deploy or plan for decommissioning
16 activities for the integrated Ballistic Missile Defense
17 System.

18 Please note that under the No Action Alternative MDA
19 would continue existing development and testing of
20 individual elements and stand-alone defensive
21 capabilities. Individual systems would continue to be
22 tested but would not be subjected to system integration
23 testing.

24 Alternative 1 and 2 provide different weapons
25 platforms through implementing an integrated Ballistic

1 Missile Defense System, while the No Action Alternative
2 continues the traditional approach to developing
3 individual missile defense elements.

4 I will now address how MDA characterizes the Ballistic
5 Missile Defense System into relevant components and life
6 cycle activities that could be considered to provide a
7 programmatic overview of the environmental impacts of
8 implementing the proposed action.

9 As mentioned earlier, MDA's goal is to develop an
10 integrated Ballistic Missile Defense System that will
11 provide layers of defense. The Ballistic Missile Defense
12 System will be capable of destroying threat ballistic
13 missiles in the boost, midcourse and terminal phases and
14 would defend against short, medium, intermediate and
15 long-range threat ballistic missiles.

16 Finally, the Ballistic Missile Defense System would
17 integrate sensors and weapons through command, control,
18 battle management, and communications or C2BMC network. With
19 this capability the integrated Ballistic Missile Defense
20 System would establish a defense against threat ballistic
21 missiles.

22 The Ballistic Missile Defense System is a complex
23 system of systems. To be able to perform a meaningful
24 impact analysis, we've considered the Ballistic Missile
25 Defense System in terms of its components; that is,

1 weapons, sensors, C2BMC and support assets.

2 These components are the building blocks that could
3 be assembled with specific functional capabilities and could
4 be operated together or independently to defeat threat
5 missiles. Testing was considered for each component.
6 However, the integrated Ballistic Missile Defense System
7 needs to be tested at the system level and was analyzed
8 separately using realistic system integration flight test
9 scenarios.

10 Let's take a look at each of the components. First
11 of all, we have weapons. Ballistic Missile Defense System
12 weapons would provide defense against threat ballistic
13 missiles. They include interceptors and directed energy
14 weapons in the form of high-energy lasers. These weapons
15 would be used to negate threat missiles. These
16 interceptors would use hit-to-kill technology, either
17 through direct impact or directed fragmentation.

18 Ballistic Missile Defense System weapons are designed
19 to intercept threat ballistic missiles in one or more
20 phases of flight that can be activated from land, sea, air
21 or space-based platforms.

22 Sensors in the Ballistic Missile Defense System will
23 provide relevant tracking data for threat ballistic
24 missiles. Sensors detect and track threat missiles and
25 assess whether or not the threat missiles have been

1 destroyed. Sensors provide the information needed to
2 locate and track a threat missile to support and coordinate
3 effective decision-making against the threat.

4 There are four basic categories of sensors considered
5 in the Ballistic Missile Defense System. They are radars,
6 infrared, optical and laser sensors.

7 Radars send a signal out and detect the same signal
8 after it bounces off an object. Infrared sensors are
9 passive sensors that detect and track heat or infrared
10 radiation from an object. Optical sensors are passive
11 sensors that collect white energy or radiation emitted
12 from an object. Laser sensors use laser energy to
13 illuminate and detect the object's motion. Radars and
14 lasers emit radiation while infrared and optical sensors
15 detect radiation that has been emitted.

16 The Ballistic Missile Defense System would operate
17 the sensors; that is, would operate from multiple
18 platforms: land, sea, air or space.

19 The data collected by the Ballistic Missile Defense
20 System sensors would travel through the communication
21 system to command and control centers where battle
22 management decisions on whether to use a defensive weapon
23 could be made.

24 C2BMC would integrate and coordinate equipment and
25 operators through command and control and integrated fire

1 control centers. C2BMC would enable military commanders
2 to receive and process information, make decisions and
3 communicate those decisions regarding the engagement of
4 the threat missile.

5 The C2BMC would include fiber optic cable, computer
6 terminals and antennas and would operate from land, sea, air
7 and space-based platforms.

8 The last category of components is support assets.
9 The support assets would be used to facilitate developing,
10 testing and deployment of the Ballistic Missile Defense
11 System components. Support assets are one of three types:
12 support equipment, infrastructure or test assets.

13 Support equipment includes general transportation and
14 portable equipment such as automobiles, ships, aircraft,
15 rail and generators. Infrastructure includes docks, ships,
16 yards, launch facilities and airports. Test assets include
17 test range facilities, targets, countermeasure devices,
18 simulants and observation vehicles.

19 Now that we've discussed the components, Mr. Marty
20 Duke will talk about how they can be integrated into the
21 Ballistic Missile Defense System.

22 MR. DUKE: This slide depicts the various components
23 of the proposed BMDS as we've just discussed. The use of
24 the multiple defensive weapons and sensors operating from
25 a variety of platforms integrated to a single C2BMC system

1 would created a layered defense allowing several
2 opportunities to intercept and destroy threat missiles.

3 For example, one weapon could engage a threat missile
4 in the boost stage. And another -- the boost phase being
5 a threat area -- and the other could be used to intercept
6 the missile threat in a later phase after an intercept was
7 unsuccessful.

8 Components are integrated into the BMDS through the
9 life cycle phase of the system acquisition process. These
10 life cycles phases are development, testing, deployment,
11 and decommissioning. These new components would undergo
12 initial development, testing while existing components
13 will be tested to determine their readiness for use. Work
14 on a given technology would stop if testing failed to
15 demonstrate effectiveness or its functional capabilities
16 needs change.

17 Components and elements would be deployed as testing
18 demonstrates that they are sufficiently capable of
19 defending against threat ballistic missiles. In most
20 cases, the components would be deployed when testing
21 demonstrated that they are capable of operating within the
22 integrated BMDS and the associated health and safety
23 procedures are developed and adequate. This process
24 concludes with decommissioning, which would occur when and
25 where appropriate.

1 To determine the environmental impact, this PEIS
2 analyzed the proposed BMDS components by considering the
3 various life cycle activities of each component as well as
4 the operating environment in which the activities are
5 taking place. This slide tries to depict the
6 multi-dimensional complexities involved in considering the
7 impact of implementing the integrated BMDS in terms of its
8 components -- which is the weapons, sensors, C2BMC -- the
9 acquisition life cycle phases and their operating
10 environments.

11 Because of the complex nature of this project
12 an analysis strategy was developed to effectively, yet
13 efficiently, look at the broad range of environmental
14 impacts for the proposed BMDS.

15 First, the existing conditions of the affected
16 environment were characterized for the location where
17 various BMDS activities are proposed to occur. Next, MDA
18 determined the resource areas that could potentially be
19 affected by implementing the proposed BMDS.

20 Finally, impacts of the BMDS are analyzed in four
21 steps. In Step 1, we identified and characterized life
22 cycle phase activity; in Step 2, we identified activities
23 with no potential for impact and dismissed them from
24 further analysis; in Step 3, we identified similar
25 activities across life cycles phases and combined them for

1 the analysis; in Step 4, we conducted the analysis -- the
2 impact analysis for all remaining activities.

3 The first three steps were used to characterize and
4 reduce the number of unique life cycle activities, thereby
5 reducing the redundancy in preparing the impact
6 analysis.

7 The affected environment includes all land, air,
8 water, and space environments where proposed BMDS activities
9 are reasonably foreseeable. The affected environment has
10 been considered in terms of broad ocean area, the
11 atmosphere and nine terrestrial biomes.

12 A biome is a geographic area with similar
13 environments or ecologies. Climate, geography, geology,
14 distribution of vegetation and wildlife determines the
15 distribution of the biomes. The biomes encompass both
16 U.S. and non-U.S. locations where the BMDS could be located
17 or operated.

18 The resource areas considered in this analysis were
19 those resources which could potentially be affected by
20 implementing the proposed BMDS.

21 NEPA analyses generally consider resource areas
22 listed on the screen except for orbital debris.
23 Because missile defense development and test activities
24 included launch and intercepting missiles, space-based
25 communications and other satellites and potential for

1 space-based interceptors, MDA also considered orbital
2 debris and its impact on the Earth. This PEIS discusses
3 all resource areas, provides the methodology for analysis
4 and suggests thresholds of significance to provide the
5 reader with a roadmap for performing future site-specific
6 analyses tiering from the PEIS.

7 These discussions outline the type of information
8 that would be needed to conduct site-specific analyses to
9 identify the steps necessary to ensure the potential
10 impacts are appropriately considered.

11 The resource areas highlighted on the slide with the
12 red star require site-specific information for analysis.
13 These resource areas are more effectively addressed in
14 subsequent tiered analysis for specific activities.
15 Once we decided how to consider the affected environment
16 and resource areas of concern, we used the four-step
17 process I mentioned before to conduct the impact analysis.
18 I will discuss each step in more detail.

19 In Step 1 of the impact analysis, MDA identified and
20 characterized the activity associated with each BMDS
21 component. Each life cycle phase has activities applied
22 to each component. For example, development can include
23 planning, research, system engineering and site
24 preparation and construction. Testing can include
25 manufacturing, site preparation, construction,

1 transportation, activation and launch activities.
2 Deployment can include manufacture, site prep and
3 construction, transportation, activation, launch operation
4 and maintenance upgrades and training. Finally,
5 decommissioning is demilitarization and disposal.

6 Once life cycle activities were identified it was
7 determined that some of the activities have no potential
8 for impact. The activities such as planning, budgeting,
9 system engineering and tabletop exercises are generally
10 categorically excluded in various Department of Defense NEPA
11 regulations and are therefore not further analyzed in this
12 PEIS.

13 Other activities for specific components such as
14 transportation, maintenance and sustainment, and
15 manufacturing are not analyzed in this PEIS because they
16 have been evaluated in previous NEPA analyses and were
17 found to have no significant environmental impact.

18 The remaining activities were then examined to
19 determine which activities had similar environmental
20 impacts. For example, impacts associated with site
21 preparation and construction in the development phase
22 would be similar to or the same as the impacts from site
23 preparation and construction activities in the deployment
24 phase.

25 Under Step 3, similar activities occurring in

1 different life cycle phases were identified and considered
2 together to reduce redundancy.

3 The final step was to determine the impact associated
4 with each remaining activity under the proposed action.
5 The significance of the impact is a function of the nature
6 of the receiving environment and the receptors in the
7 environment. For example, an interceptor launch creates
8 the same emission no matter where it's launched. Whether
9 those emissions cause impact, the significance of those
10 impacts depend on the environment in which they are
11 released. The PEIS analyzed these emissions by component
12 for each resource area and life cycle activity where a
13 potential for impact was identified.

14 Impacts were distinguished based upon the different
15 operating environments: land, sea, air and space. The
16 analysis also considered specific impacts for individual
17 biomes where activities could occur. The impacts of
18 system integration testing was considered separately from
19 the impact of the individual component testing.

20 Integration testing involved using multiple
21 components in the same test. To deal effectively with
22 integration tests, MDA looked at two generic system
23 integration flight test scenarios which involved a
24 different number of launches and interceptors. The impact
25 analysis for Alternative 1 considers the use of land, sea

1 and air-based platforms for BMDS weapons.

2 The analysis includes the use of space-based sensors
3 but not space-based weapons. The analysis was specific
4 for each resource area based on the impact from the
5 activities associated with the BMDS components.

6 The impact analysis for Alternative 2 includes the
7 use of interceptors from land, sea, air, and space-based
8 platforms for BMDS weapons. The impacts associated with
9 the use of interceptors from land, sea and air platforms
10 would be the same as those discussed for Alternative 1.
11 Therefore, the analysis of Alternative 2 focuses on the
12 impact of using interceptors from space-based platforms.

13 The fundamental difference between Alternative 1 and
14 2 is that Alternative 2 includes the analysis for
15 space-based platforms for interceptors.

16 The cumulative impact of implementing the BMDS was
17 also considered. The cumulative impacts are defined as
18 impacts that result from the incremental impacts of the
19 proposed action when added to other past, present, or
20 reasonably foreseeable future actions. Because this
21 proposed action is worldwide in scope and potential
22 application, only activities similar in scope have been
23 considered for cumulative impact.

24 Under Alternative 1 worldwide launch programs for
25 commercial and government programs were determined to be

1 similar in scope; therefore, the impact of BMDS launches
2 would be considered cumulatively with the impacts from
3 other worldwide government and commercial launches.

4 Alternative 2 includes placing defensive interceptors
5 in space, which involves adding additional structures in
6 space for an extended period of time. The International
7 Space Station was determine to be an action that is international
8 in scope that has a purpose of placing structures in space
9 for an extended period of time; therefore, the impacts of
10 the use of space-based weapons platforms were considered
11 cumulatively with the impacts of the International Space
12 Station.

13 The next few slides provide broad summaries of the
14 impact analysis by the BMDS components and Test
15 Integration for Alternatives 1 and 2, a No Action
16 Alternative and the Cumulative impacts for Alternatives 1
17 and 2. Please note the results are extremely high level,
18 suitable for this presentation. Additional details have
19 been provided in some of the posters in the back room in
20 the hallway. And, also, the impact analysis may be found
21 in the Executive Summary Impact Tables and in Section 4 of
22 the Draft PEIS.

23 It's important to note that no environmental
24 showstoppers were found in the Programmatic Envi4ronmental Impact
25 Analysis. As the next few slides show, there are

1 potential impacts associated with the various activities
2 needed to implement the BMDS; however, they would be
3 appropriately addressed in subsequent tiered NEPA
4 analyses along with the mitigation actions, as required,
5 to ensure less than significant impacts.

6 This slide shows the summary of the broad potential
7 for environmental impacts associated with the BMDS weapons
8 activities, as examined, for each resource area for
9 Alternatives 1 and 2. Please note, this is a very
10 high-level depiction of the results of the analysis. And
11 additional details of the weapons analysis can be found in
12 the tables of the Executive Summary and the Draft PEIS.
13 However, one can see from this slide the general
14 activities and resource areas that should be considered in
15 subsequent tiered NEPA analyses.

16 This slide shows the impact summary for the BMDS
17 sensor components. Note the impacts are the same for
18 Alternatives 1 and 2 and include space-based sensor
19 platforms. This summary also shows how MDA
20 characterization of activities helps to simplify the
21 analysis. For example, the activation of the radars would
22 not impact air quality because the only emissions
23 resulting from radars would be from supporting diesel
24 generators, which are addressed under support assets.
25 However, radars generate electromagnetic radiation which

1 could potentially impact biological resources.

2 Although C2BMC is the glue that enables the
3 integrated BMDS to function effectively as a system, this
4 component creates little potential for environmental
5 impact.

6 Impacts associated with support assets are mainly
7 those that would be caused by site-preparation and
8 construction of the infrastructure and by using test
9 assets such as countermeasures and simulants during
10 testing.

11 Test integration overall has the most potential for
12 impact because it includes the use of several components
13 during increasingly realistic test scenarios. Although
14 this programmatic analysis shows the potential for impact,
15 the existing environment of the post-test location of the
16 specific test activities plan would determine the nature
17 and extent of the impact.

18 The No Action Alternative would continue the
19 development and testing of individuals weapons, sensors,
20 C2BMC and support assets and would not include
21 integration testing of these components. The
22 environmental impact of the No Action Alternative would be
23 the same as the impact resulting from continued development
24 and testing of the individual missile defense elements.
25 The decision not to deploy a fully integrated BMDS could

1 result in the inability to respond to a ballistic missile
2 attack on the U.S. or its deployed forces, allies or
3 friends in a timely and successful manner.

4 Further, this alternative would not meet the purpose or
5 the need of the proposed action or the specified direction
6 of the President or the United States Congress.

7 We examined the impact of the worldwide launches for
8 cumulative impacts. Launches can create cumulative
9 impacts by contributing to global warming and ozone
10 depletion. Central launch emissions that could affect
11 global warming include carbon monoxide and carbon dioxide,
12 which is CO₂. Unlike CO₂, carbon monoxide is not a
13 greenhouse gas; it can contribute indirectly to the
14 greenhouse gas effect. Cumulative impact on global
15 warming of emissions from BMDS launches would be
16 insignificant compared to other industrial sources, such
17 as energy generation.

18 The BMDS launch emission load of CO₂ and carbon
19 monoxide would only be 5 percent of the emission loads for
20 worldwide launches. In addition, CO₂ and carbon monoxide
21 in 10 years of BMDS and worldwide launches combined would
22 account for much less than 1 percent of CO₂ and carbon
23 monoxide emissions from U.S. industrial sources in a
24 single year.

25 Chlorine is a primary concern with respect to ozone

1 depletion. Launches are one of the man-made sources
2 of chlorine in the stratosphere. The cumulative impacts
3 of stratospheric ozone depletion from launches would be
4 far below the effect caused by natural and man-made
5 sources. The emission loads of chlorine from both BMDS
6 and other launches worldwide occurring between 2004 and
7 2014 would account for half of 1 percent of the industrial
8 chlorine load from the U.S. in a single year.

9 The orbital debris produced by BMDS activities would
10 be generally small in size and consist primarily of launch
11 vehicle hardware, old satellites, and bolts and paint
12 chips. It may also be possible for debris from an intercept to
13 become orbital debris. However, orbital debris produced
14 by BMDS activities would occur in low Earth orbit where
15 debris would gradually drop into successively lower orbits
16 and eventually reenter the atmosphere; therefore, orbital
17 debris from BMDS activities would not pose a long-term
18 hazard to the International Space Station or other
19 orbiting structures.

20 In addition, collision avoidance measures would
21 further reduce the potential for orbiting debris to damage
22 structures in space such as the International Space
23 Station.

24 I'd like to reiterate that our impact analysis
25 indicated no showstoppers or expected areas of significant

1 impact. However, many resource areas showed potential for
2 impact indicating these areas need to be considered in
3 subsequent analyzed analysis tiered from the PEIS.

4 Now, I'd like to turn the meeting back over to Peter
5 who will talk about the administrative process and how
6 we're going to take the public comments.

7 MR. BONNER: Thank you, Marty. Now that we've looked
8 at the proposed BMDS and the potential impacts of
9 implementation, let's discuss the PEIS schedule.

10 The Notice of Intent was released April 11 of 2003 in
11 the Federal Register. The MDA released the Draft PEIS in
12 September 2004.

13 The public comment period, which we're in right now,
14 will continue through November 17, 2004. After that time
15 the MDA will consider all comments received and
16 incorporate appropriate changes into the Final PEIS. A
17 release date for the Final PEIS is estimated between
18 December and January 2004 -- 2005.

19 After release of the Final PEIS, there will be a
20 30-day waiting period before the MDA can issue the Record
21 of Decision or ROD. I think that is our last acronym.

22 There are a number of ways in which you can provide
23 comments on the Draft BMDS PEIS. You can provide your
24 comments orally or in writing. Oral and written comments
25 will be given equal consideration in the Final PEIS. If

1 you would like to make a public statement at tonight's
2 meeting, please sign up at the registration table and fill
3 out a speaker's card during the break.

4 Each speaker will be given five -- or three minutes
5 to make a statement, as mentioned earlier. Public
6 statements by tonight's speakers will be recorded by a
7 court reporter to ensure that we accurately capture your
8 comments on the Draft PEIS. There is also a toll-free
9 telephone number that you can use to submit comments.

10 Please refer to the handouts you've got for the
11 toll-free telephone number. Another option is to submit
12 your comments in writing. There are four ways to do that.
13 You may leave your written comments with us if you brought
14 them with you. Second, you can use the comment forms
15 available at the registration table to write down your
16 comments and also leave those with us. You can either
17 turn them in tonight or fax them to us. Third, you can
18 email your comments to MDA at the email address listed on
19 the screen. Finally, you can submit your comments through
20 the PEIS website on an electronic form we have.

21 Again, to ensure your comments are adequately
22 considered in the Final BMDS PEIS, they must be received
23 no later than November 17.

24 The information on the screen lists the various ways
25 you can submit comments. Information is also listed on

1 the comment forms on the registration table, the MDA PEIS
2 website, and the handouts near the posters. Please visit
3 the BMDS PEIS website for additional information. The
4 website provides the descriptions of the topic areas we
5 touched on this evening, as well as links pertaining to
6 additional information. The materials handed out tonight
7 are posted on the BMDS PEIS website.

8 We encourage you to sign up for the hard copies of
9 the Executive Summary of the Final PEIS and the CD-ROM
10 containing the entire document when it becomes available.
11 To do this, please fill out the appropriate forms at the
12 registration table. You can also request a copy of the
13 Executive Summary or CD-ROM of the entire document by sending
14 us an email, again, at the address listed on the screen.

15 The Final PEIS will be also be available in pdf
16 format to download from the website and hard copies will
17 be placed in local libraries. A list of these libraries
18 is available on the website.

19 Marty, final comments?

20 MR. DUKE: Again, our role here tonight is to provide
21 you the opportunity to address your concerns firsthand so
22 we can consider those in the preparation of the Final
23 PEIS.

24 Remember, no decisions on this project will be made
25 tonight. But you -- we do want to make sure you have the

1 opportunity to provide us the comments. Again, please
2 provide comments in the various methods that Peter
3 explained. I think there is a handout with all of that
4 information you can pick up and take with you but we need
5 the comments and request they be submitted no later than
6 November 17th(sic).

7 Now we are going to take about a 10 to 15-minute
8 break to set up for the public statements period. You can
9 sign up at the registration table if you'd like to make a
10 public comment.

11 After the public comments period we'll be available
12 back at the poster areas to answer any further questions
13 you may have. Okay.

14 Thank you.

15 MR. BONNER: Also, if you didn't sign up when you
16 first came in, even if you are not making a public
17 comment, if you could sign up at the front table.

18 Thank you.

19 (Brief recess taken from 7:11 p.m. to 7:26 p.m.)

20 MR. BONNER: Let's come back together and let's get
21 started.

22 Can you take your seats, please. I have the list of
23 registered speakers and I'll call each person to the
24 microphone to speak.

25 Again, please limit your remarks to three minutes.

1 To help you keep track of time, after about two and a half
2 minutes I'll hold up this very professionally done sign
3 and you'll know you need to wrap up.

4 If you do have a written version of your comments, we
5 ask you provide that to us so we can accurately keep a
6 record of your statements. When providing your public
7 comments, remember to state your name and your affiliation
8 as clearly as possible so we can pick it up as we record
9 the meeting.

10 If you don't wish to give an oral statement tonight,
11 please take advantage of the many opportunities we've
12 tried to lay out for you to make other comments.

13 With that, let's start. Alan Stahler. Is it Stahler
14 or Staler(phonetic)?

15 ALAN STAHLER: Stahler. My name is Alan Stahler. I
16 live in Nevada City, California. The World Trade Center
17 towers were not taken down --

18 MR. BONNER: One second. Two, three --

19 ALAN STAHLER: My name is Alan Stahler. I live in
20 Nevada City, California. The World Trade Center towers
21 were not taken down by ballistic missiles. The USS Cole
22 was not attacked by ballistic missiles. The Federal
23 Building in Oklahoma City was not destroyed by ballistic
24 missiles. Any country knows that we know that they know
25 that we know that any launch of a limited ballistic

1 missile attack, as described in the handout we got today,
2 would be suicidal.

3 They know that we know that they know we know their
4 country would be dust in an hour of any such attack. The
5 handouts says four-fifths of the tests of the system so
6 far were interceptions. I realize that that depends on
7 what your definition of what "interception" is; but in
8 most of the world, almost only applies in horseshoes. I'd
9 like to know what would be the environmental effect, the
10 environmental impact if the system is deployed but does
11 not work?

12 What are the immediate effects to the environment in
13 which we live? What are the effects of our environment on
14 how we live on diverting financial resources? The
15 handouts didn't say anything about what this would cost
16 now or in the future. What are the effects on our
17 environment of diverting the intellectual resources that
18 could go to better places? What are the environmental
19 effects of diverting skilled work that could be applied to
20 building schools, libraries, roads, bridges, you name it?

21 MR. BONNER: Thank you. Miles Everett.

22 MILES EVERETT: Thank you all for this opportunity.
23 My name is Miles Everett. I'm from Healdsburg,
24 California. I'm involved with the Alliance for Democracy
25 and that is what brings me to these particular concerns.

1 I, too, am concerned about a broader definition of
2 environment. And one of the things that concerns me a
3 great deal about this present project is that the
4 technical environment for making it work does not seem to
5 be up-to-speed. The Union of Concerned Scientists says
6 that the project that is about to be launched has no
7 assurance of working at all. And Thomas Christy, who is
8 the head of one of the testing agencies of the Pentagon,
9 says he has no assurance that the part of the system about
10 to be deployed would even protect Alaska against a missile
11 from North Korea.

12 I'm also concerned about the financial environment.
13 Apparently, a hundred billion dollars has been spent thus
14 far. 10 billion more is asked for 2005; another 53
15 billion for 2004 and 2009. The layered project, I would
16 suggest, is a kind of a cover for a blank check, which
17 will keep us paying for these weapon systems until we're
18 all gone.

19 We have a huge deficit. We have many demands and yet
20 they want to dig that deficit hole much deeper by this
21 particular project. What about the environment for
22 international relations? What is world opinion to make of
23 this situation where the United States charges ahead
24 because it's rich enough to -- to try to build an umbrella
25 which protects it, at the same time it announces its

1 policies of preemptive war.

2 We already had one comment from an Iranian general
3 who said, "Well, clearly, if you're going to be dealing
4 with the United States in the future, you have to have
5 nukes or you can't even get their attention."

6 What about American opinion? The idea that somehow
7 we'll be safer under this umbrella, which will be
8 sold -- you can imagine -- the Whitehouse and the Pentagon
9 will sell this idea right off the face of the earth that
10 now we're going to be safe under this umbrella.

11 I thought that I heard a number of times from this
12 Administration that 911 changed everything. And it ought
13 to have changed this 21-year-old strategy that goes back
14 to the Cold War before we had a great many of the
15 satellite surveillance systems and so forth that cover the
16 entire globe that make it impossible for anybody to set up
17 without us knowing about it and be able to follow the
18 process.

19 MR. BONNER: You've got about 30 seconds.

20 MILES EVERETT: It does not do anything, obviously,
21 to address the great multitude of threats that have been
22 so much talked about since 911. It's simply a huge
23 distraction from our real problems of learning how to live
24 on this globe with all of the people on the globe. And
25 the implications -- finally, the implications of

1 destroying missiles, which presumably would be nuclear
2 armed missiles, destroying them in flight and suggesting
3 that is a worthy desirable objective is a -- that is a
4 very dubious proposition.

5 They will tell you that the nuclear warhead does not
6 necessarily explode. But certainly the technology that
7 can create this mammoth system can also create a system
8 which would cause a nuclear warhead to explode when and if
9 it's intercepted.

10 So we have warheads going off around the globe
11 wherever we happen to intercept it. That does not create
12 a very attractive environment for human beings.

13 MR. BONNER: Robert Alpern.

14 ROBERT ALPERN: Good evening everyone. Thank you for
15 the opportunity to have citizens' comments.

16 I think we've said that the environment is much
17 broader than what this statement calls for. The
18 environment is a social and cultural environment that we
19 need to take into consideration as we consider building
20 such a new and costly provocative system.

21 The National Intelligence Estimate of 2001 for the
22 Bush Administration says, and I quote, An attack on U.S.
23 territories is more likely to be -- we are more likely to
24 be attacked by countries or terrorists by using ships,
25 trucks, airplanes or other means, rather than long-range

1 ballistic missiles.

2 We're still in the era of the Cold War in thinking
3 about these missiles and this program to create this
4 artificial and flawed umbrella for the people of this
5 country. What are the effects on other countries of this
6 provacative system? It is thought likely that China will
7 increase its production of nuclear weapons to overwhelm
8 this system, which is very easily overwhelmed by decoys
9 and numbers. This system, as we now know it, is meant to
10 ideally knock out a very few incoming missiles, not at all
11 the kind of attack that possibly could occur. It is
12 flawed in that respect.

13 The Pentagon itself in an analysis called the
14 Ballistic Missile Defense System, a Case Study Against
15 Rushing Forward on a Missile System. The Pentagon itself
16 said that. And yet we're -- we have spent a hundred
17 billion dollars. We're planning to spend 83 billion more
18 over the next ten years and we have nothing to show for it
19 except neglected communities, depleted healthcare systems
20 and actual environmental neglect of the real environments
21 that we all daily live in.

22 This proposal that we're asked to address tonight
23 does not contain a real No Option Alternative not to build
24 the system, to abandon it. That is what I think most of
25 the people in the United States and the world would

1 affirm.

2 This system's impact on traditional arms control and
3 disarmament efforts would be profound. We've already
4 vitiated the Anti-Ballistic Missile Treaty under this
5 Administration. We're preparing to resume nuclear weapons
6 testing at the Nevada test site. We're building a whole
7 series of new nuclear weapons, the mini nukes and bunker
8 buzzards.

9 We're prepared to fight preemptive wars and yet this
10 antiquated system that is going to cost you and I and our
11 fellow Americans the treasures of our society that are
12 already depleted by the Iraq war and other weapons
13 spending, we're asked to do this. And I say we must
14 abandon this program and utilize our resources in more
15 constructive ways and practicing the ways of diplomacy
16 negotiations and building alliances, instead of acting
17 unilaterally, which is what this program does.

18 Thank you.

19 MR. BONNER: Karen Blomquist.

20 KAREN BLOMQUIST: Hi. I'm a nurse and I therefore
21 know the difference between preventive care and just
22 treating the symptoms.

23 Star Wars just treats the symptoms of aggression.
24 And like most efforts to treat the symptoms, while
25 ignoring the real problem, these efforts will make the

1 problem worse. As an example, taking an aspirin for a
2 headache, which is a symptom of an impending stroke, is
3 not going to help the problem.

4 Star Wars is an aggressive move that will only foster
5 aggressive feelings and eventually aggressive actions from
6 other countries. Continuing to bully other countries
7 around is not going to win us alliances. It does just the
8 opposite. Most countries, if not all, will end up hating
9 us. And as it fosters this aggressive action, Star Wars
10 will clog up the space over our Earth. The consequences
11 of which we do not fully know.

12 Like food additives that are now found to cause -- or
13 possibly cause mood disorders and ADD, what might clogging
14 up the space surrounding Earth with satellites and debris
15 do? While we shoot more satellites up into air spewing
16 perchlorate into our atmosphere, how much of our ozone
17 will be left to protect all life from destruction of the
18 sun's rays?

19 If the satellites break and accidentally misfire or
20 fire on their own, how many satellite or accidental
21 misfires will it take before World War III?

22 Star Wars is an action of those who do not -- do not
23 live in reality but live in some -- but live in some
24 self-centered devil worshipping dream world of control
25 that will ultimately cause the rest of us who live in a

1 nightmare of terror, while destroying the very Earth upon
2 which we live.

3 MR. BONNER: Thank you, Karen. MacGregor Eddy.

4 MACGREGOR EDDY: Hi. I came here from Salinas to
5 speak on this. And in Salinas they're proposing closing
6 all of our public libraries. Why? Because they don't
7 have enough money.

8 Well, where is the money going? I propose that 1.3
9 trillion dollars for Star Wars is a good example of where
10 the money is going. Closing all of the public libraries
11 completely in a town that is 66 percent Hispanic American,
12 in a town that produces 80 percent of the lettuce you eat.

13 Let's take a look at what the program is. And I'll
14 address it environmentally. I have copies of my
15 statements if anybody wants it. Here you go. Here. Pass
16 them around.

17 Statements from MacGregor Eddy. I'm an advisory
18 board member of the Global Network Against Weapons and
19 Nuclear Power in Space regarding the Programmatic Impact
20 Statement of the PEIS Ballistic Missile System presented
21 October 19th, Sacramento, California.

22 One, the 515 launches which is far more than the 99
23 commercial launches that are proposed. By the way, I came
24 here expecting a fairly honest presentation of the PEIS
25 and I was shocked at the scummy lies I heard by people I

1 regard as honest people. It's ridiculous that
2 the -- there is 515 launches proposed for Star Wars. That
3 is five times the amount that would be launched under the
4 programs that are non-Star Wars. And you can look this up
5 for yourself. Don't trust me. Check it out.

6 The second thing is the PEIS is based on the Star
7 Wars program as proposed -- and here we have a statement.
8 Okay. This statement was made by General Henry Tray
9 Obering. He's the head of the Missile Defense Agency. So
10 this is not a statement from some conspiracy website.
11 This is a statement from the head of the MDA. What did he
12 say when he was speaking at a Homeland Security conference
13 on a missile defense panel on October 13th in Colorado
14 Springs, Colorado? He was asked about the THAAD, which is
15 the Theater High Altitude Defense Missiles that are
16 scheduled to go into production in 2005. He was asked
17 about these.

18 What did General -- General Henry Tray Obering say
19 about the missiles? He said, quote, These missiles are
20 intended to augment, not replace, the current generation
21 of ground-based midcourse interceptors.

22 That is what we're talking about here tonight,
23 ground-based midcourse interceptors. In fact, there will
24 be a continued spiraling of the capabilities of missile
25 network with more missiles and additional sites added to

1 the current missiles and expansion of the Theater High
2 Altitude Defense Missiles beyond the initial scheduled 25
3 missiles. Therefore -- hey, listen. Therefore, the
4 program they're talking about includes far more missiles
5 than the ones they're proposing.

6 The second thing is the PEIS does not evaluate the
7 environmental impact of No Action Alternative; thus, does
8 not comply to the National Environmental Policy Act.

9 And three, the PEIS does not address the
10 environmental impact of the response to ballistic missile
11 defense systems by other countries. For example, China is
12 planning to increase the number of missiles they have in
13 direct response to our ballistic missile program. And
14 this PE -- this Environmental Impact Report does not
15 address the effect of testing, deployment and
16 decommissioning of these two missiles in China, which is a
17 direct result of our policy. And this is not included in
18 the Environmental Impact Report.

19 The report -- since No Action Alternative was not
20 considered seriously in the impact report, I say it is not
21 an impact report at all. Therefore, it has not complied
22 with the legal requirements; therefore, it should be
23 stopped.

24 Thank you.

25 MR. BONNER: Thank you. Rod Macdonald.

1 ROD MACDONALD: I'm Rod Macdonald. I'm a
2 professional wetland scientist. I work with identifying
3 wetland ecosystems, their components, soils, water
4 quality, their functionality. I modify them, restore
5 them, recreate them under occasion, so forth. So I know
6 what I'm talking about. I'm a registered wetland
7 scientist, which means, like a structural engineer, I'm
8 educated. But I have a reputation to lose, if I don't get
9 the facts right.

10 I guess what disturbs me is I read Science Magazine.
11 It comes out 52 times a year. It's uncensored. You'd be
12 surprised of the things you'll see in there. Anyway,
13 there is a lot of discussion about missile systems that
14 comes from the point of view of the National Academy of
15 Science. And, of course, there is a broad range of
16 opinions of scientists, like anyone else. It's sort of a
17 scientific engineer-based discussion.

18 I want to talk about what an Environmental Impact
19 Statement is supposed to be under the NEPA, National
20 Environmental Quality Act. It's supposed to look at a
21 cradle-to-grave analysis of a project. It's supposed to
22 minimize the impact at every state, in every level, every
23 decision within it.

24 I really think it's a great thing to take a program
25 like this which has a huge cumulative impact and look at

1 it in a systematic cumulative way. That's what it says it
2 does; but, unfortunately, it's not what it does. It
3 provides a false set of figures upon which to compare what
4 the real impacts would be. Instead of trying to look at
5 where we have to go if we want to deploy the system -- I'm
6 not willing to take a stand about whether I agree the
7 system should or shouldn't be built. I think despite all
8 terrorism, the possibility of a missile launched from a
9 disguised container off of the coast is realistic and
10 we'll never know who put it in that container but we'll
11 need to shoot it down.

12 But my argument isn't with the waste of money, if it
13 may be an overblown system or its provocative nature; but,
14 instead, it really does not address what is going on. And
15 the reason it doesn't is it provides -- I'll look at
16 perchlorates. Perchlorates are important to amphibians.
17 Amphibians are in a worldwide decrease.

18 If you look at the report, all the report ever says
19 is "hazardous waste will be handled and dispersed in
20 accordance with appropriate regulations; therefore, no
21 significant hazardous materials and hazardous waste impact
22 will be expected."

23 They go through and they say this for every single
24 thing. The vegetation and so forth won't be or "we'll do
25 a tiered-site analysis and a certain site will be

1 affected" but it won't. But the truth is over the decade
2 life of the program, the global level of perchlorates may
3 rise. Amphibians skin needs to be moist. They're very
4 sensitive to all industrial chemicals. 70 percent of the
5 species are in decline right now, even in habitats that
6 aren't disturbed.

7 Why would we care about them? The mosquitos are
8 coming out. We don't have hard figures. We don't have
9 real analysis. We're told this is a half a percent. What
10 they're disguising there is most of the chemicals are
11 residual from former manufacturing processes. And even
12 so, the largest contributor -- as a scientist, I'm simply
13 telling you, the largest contributor actually is the
14 manufacturing, testing, open detonation of old rocket
15 motors and the whole thing.

16 Just to say there would be no impact -- this is a
17 negative deck. We've all seen negative decks. They go
18 through and check off negative deck. Negative deck.
19 Negative deck. This isn't an honest -- this isn't a
20 scientific discussion. I'm aware of what NEIR is. I've
21 dealt with them for 25 years.

22 Thanks.

23 MR. BONNER: Thank you. Jimmy Spearow.

24 JIMMY SPEAROW: Thank you. The -- the --

25 UNIDENTIFIED SPEAKER: Take a deep breath, Jimmy.

1 JIMMY SPEAROW: The PEIS underplays many
2 environmental effects of the BMDS. The Ballistic
3 Missile -- I'm sorry. The Ballistic Missile Defense
4 System PEIS does not address several of my scoping
5 comments to start with and does not adequately address
6 several risks, including exposure to increased levels of
7 toxic pollutants from a dramatic increase of missile
8 launches.

9 As we know, the -- the perchlorates are used in the
10 self-propellants in the formation of a key thyroid hormone
11 which are critical for growth and development of fetuses
12 and children. The PEIS proposes to allow over thirty-fold
13 higher levels of perchlorate at 200 parts per billion than
14 proposed by the State of California, which is six parts
15 per billion. Thus, many rocket launches will inject
16 chemicals including aluminum oxide, hydrogen chloride and
17 hydrochloric acid directly into the upper atmosphere,
18 thereby depleting the ozone.

19 The PEIS does not address the direct injection of the
20 chemicals high into the atmosphere. Secondly, the BMDS
21 PEIS underestimates the risk of health and safety of BMDS
22 missiles accidentally shooting down civilian and/or
23 friendly military aircraft.

24 BMDS has failed to mention the U.S. missile systems
25 have a history of accidentally shooting down aircraft.

1 Consider the U.S. has seen the Pac-3 missiles, which
2 are -- which are in the PEIS, actually shot down several
3 U.S. and allied jets -- two or three in this case
4 of -- I'm sorry -- in two of the cases of the recent
5 invasion of Iraq. There is also Flight TWA 800. And even
6 though several people saw streaks going up toward it, the
7 people that saw it were never allowed to testify.

8 The -- the point is that the activation of the BMDS
9 risk accidentally shooting down civilian airliners is not
10 even considered in the BMDS. It's a risk to health and
11 safety. While the BMDS states that warning will be
12 provided to enable time to clear the air space, it's
13 highly doubtful that such time would be allowed in such an
14 emergency.

15 Also, the PEIS underestimates the effects of space to
16 reach from high altitude midcourse missile intercepts in
17 the destruction of satellites, particularly at high
18 altitude.

19 Furthermore, while the PEIS considers testing the
20 BMDS on targets of opportunity, no mention is of the space
21 debris resulting from U.S. targets of opportunity or other
22 nations' targets of opportunity. The environmental
23 consequences of mini rocket launches needed to deploy and
24 maintain space-based interceptors has not been adequately
25 considered, nor has its environmental consequences of the

1 fuel. They talk about having all of the -- these -- in
2 other words, in Option 2, they have many different
3 interceptors in space that would have a reduced
4 environmental consequence. But there's no consideration
5 you have to launch all of those missiles in the place to
6 get there.

7 Also, will the space-based satellites use nuclear
8 power sources? Will any BMDS interceptors use nuclear
9 warheads? This was not clearly defined. This is
10 unsatisfactory. The BMDS does not include a real No
11 Action Alternative. Such an alternative does not include
12 further development and testing and deployment of these
13 weapon systems needs to be considered and included in the
14 PEIS. The PEIS does not consider a No Action Alternative
15 at all. In other words, something that would involve
16 rejoining the UN and -- and many other nations of the
17 world in order to enhance security through treaties and
18 arms control, sovereign approaches; i.e., approaches that
19 provided us with long-term security to date.

20 Also, the PEIS, has not considered any -- has not
21 considered any radioactive follow-up from interceptive
22 missiles. The effects of war are not excluded for the
23 analysis of NEPA. However, the proposed BMDS action is
24 likely to promote a worldwide weapons of mass destruction
25 arms race and force other nations to prepare a massive

1 retaliation against the U.S., should war ensue.

2 Since the proposed BMDS is very likely to cause a
3 massive arms race, the environmental consequences of a
4 resulting war with nuclear and other weapons of mass
5 destruction should not be ignored.

6 The PEIS needs to consider the environmental effects
7 that follow up from interceptive weapons of mass
8 destruction, as well as effects of weapons of mass
9 destruction the BMDS fails to intercept. This needs to be
10 considered relative to a true No Action Alternative.

11 Thank you.

12 MR. BONNER: Pallo Deftereos.

13 PALLO DEFTEREOS: I'm Pallo Deftereos, Chairman of
14 the Sacramento Committee for Nuclear Arms Control. I
15 oppose national missile defense, not primarily because it
16 is a near-term threat to our environment but because it
17 threatens human survival.

18 My concerns are shared by many senior military
19 officers, Nobel Laureate scientists and diplomats. I've
20 been collecting literature on the nuclear weapons issue
21 for over 20 years. Fred Takikowa of my committee will
22 give you an envelope containing a sample of my collected
23 literature. I gave your agency some of the same articles
24 at last year's hearing.

25 My combined total of employment with the State and

1 Federal government was almost 40 years. So I know how
2 government works. My differences are not with the MDA
3 representatives who are here tonight. They are instead
4 with Federal decision-makers at a far higher level than
5 these gentlemen.

6 Thank you.

7 MR. BONNER: Thank you. Dan Bacher. Do you want to
8 use the hand-held mic, Dan?

9 DAN BACHER: Does not matter. Where is that? Yeah.

10 Hi. I'm Dan Bacher, Central American Action
11 Committee member and long-time environmental and peace
12 activist. And I suggest an Alternative Number 4, which
13 means scrap the entire PEIS and the whole program that
14 they are presenting here.

15 This is a colossal waste of taxpayers money that
16 could be spent on just about anything else other than this
17 and it would be productive. There is a hundred billion
18 dollars that have been spent and another 83 billion that
19 are planned to be spent over the ten years if this Star
20 Wars goes into effect.

21 The crazy thing about this is there is no imminent
22 threat of weapons of mass destruction or space weapons at
23 least on Earth. I have three questions that I'd like
24 included in the comment period of the document.

25 Number 1, are we afraid of the zany folks from

1 Zetaraticuli from launching ballistic missiles at
2 Washington, D.C.? Are we terrified of the peaceful and
3 highly evolved inhabitants of Europa from launching WMD's
4 at New York? Number 3, are we afraid of the wonderful
5 civilization of the third planet from Orion launching a
6 massive terrorist attack here on us in Sacramento? No. I
7 don't think so. Unless the government isn't telling us
8 something about this.

9 Who are we protecting ourselves against?

10 Okay. What I think that -- a better thing than
11 calling this all of the acronyms that have been given out
12 here on this wonderful PowerPoint presentation, I think it
13 could be summed up as "Lost in Space."

14 The people that came up with the Star Wars
15 technologies whole concept are out of their minds. This
16 is the ultimate corporate welfare project.

17 You know, I -- I'd like to conclude with the fact
18 that we -- we need to get rid of this whole Star Wars
19 project and the PEIS and everything else and get the
20 weapons contractors off welfare.

21 And when I've been out demonstrating I get this stuff
22 from people, "Why don't you get a job?" Well, I've had a
23 job for years. You know, I've been employed the whole
24 time. What I'd like to say to the people that are
25 proposing Star Wars and the Missile Defense System is to

1 get a job, weapons contractors.

2 MR. BONNER: Thank you, Dan. Bill Durston.

3 BILL DURSTON: Dan is a hard act to follow. Anyway,
4 turning some of the comments that have already been made
5 relating back to the Environmental Impact Report, the
6 Environmental Impact Report has to consider the chain
7 reactions. The report on cutting down old growth Redwoods
8 considers the effect it will have on the spotted owl. The
9 Ballistic Missile Defense program will have effect on a
10 lot more than just spotted owls.

11 It's not only a likelihood, it's a certainty that
12 other countries will react to us developing a Ballistic
13 Missile Defense System, however flawed it might be. And
14 they will react likely by developing more ballistic
15 missiles to overcome the defense system. I've seen
16 nothing in the environmental report on this system that
17 takes into account how other countries will react.

18 So the effects of the more missile launches, more
19 rocket fuel contaminates going into the water, more
20 depletion of the ozone are not just those of the Ballistic
21 Missile System being described here. All of the effects
22 of the proliferation of ballistic missiles around the
23 world must also be considered in a serious Environmental
24 Impact Report.

25 Similarly, with the weaponization of space it has

1 been mentioned that other countries are unlikely to be
2 able to afford similar space-based interceptors. Well,
3 the fact is, the U.S. cannot afford this system either.
4 Nevertheless, it wouldn't take much money to send
5 satellites into space to purposely explode and create
6 space debris that would make the space-based interceptors
7 ineffectual and would also make the communication
8 satellites ineffectual and so on and so forth, basically,
9 sabotage space for military and civilian use.

10 This should be considered quite seriously in an
11 Environmental Impact Report on this system. I don't see
12 any consideration of that. That would be a very simple
13 way another country could stop the whole system.

14 You know the alternative. This has been alluded to.
15 The alternative has to be considered. The alternative of
16 land, sea, air and space-based defense systems are being
17 considered. The alternative of a diplomacy-based defense
18 system is not considered. In fact, diplomacy seems to be
19 a -- a foreign concept to the current Administration.

20 But as we now know, UN weapons inspections work quite
21 well to eliminate weapons of mass destruction. And
22 similar systems could be deployed around the world, as was
23 deployed in Iraq, and eliminated all of the weapons of
24 mass destruction. These might not meet the needs of
25 Congress, the President and the likes of Dick Cheney and

1 those with egregious economic conflicts of interest, as
2 Dan alluded; but they would meet the needs of the American
3 people.

4 Talk about showstoppers. This Ballistic Missile
5 System is a threat to the survival of all living species
6 on Earth. That is a very definite showstopper.

7 Thank you.

8 MR. BONNER: Thank you. Mr. Jaskowski.

9 HELEN JASKOWSKI: I'm not Mr. Jaskowski.

10 MR. BONNER: Sorry about that.

11 HELEN JASKOWSKI: My name is Helen Jaskowski and I
12 live in San Pedro. I have to leave in a few minutes
13 because we have to take a bus back to our campground.

14 I want to -- and Jonathan Paatrey from the Physicians
15 for Social Responsibility will take up whatever time may
16 be left from mine.

17 I am responding to the first paragraph here, the need
18 for missile defense. In 1973 I was a Fulbright lecturer
19 at a university in Poland. This was the Cold War. I
20 lived behind the Iron Curtain and was sent back there
21 several times more by the government to do teaching.

22 Would I have felt safer with this kind of system in
23 place at that time with those threats? No, of course not;
24 neither I, nor the people I lived among in Poland, nor the
25 people I came home to here.

1 This statements says this thing is needed to protect
2 ourselves, our allies and our friends. Does not name who
3 the allies and friends are. We have fewer and fewer of
4 them as every day passes. And this system will destroy
5 any that are remaining.

6 MR. BONNER: Dorothy Houston.

7 DOROTHY HOUSTON: My name is Dorothy. I live in Los
8 Angeles. I'm a citizen and taxpayer. Thanks, Mr. Graham,
9 for having us here.

10 I'm opposed to the BMDS because the system would
11 create a new arms race. Nuclear states will develop
12 faster, smarter weapons and faster, smarter weapons
13 delivery systems. It's only in videogames that the U.S.
14 could protect itself from nuclear conflagration.

15 I'm opposed to the BMDS because it would undermine
16 any effort at multi-lateral nuclear weapons disarmament
17 and summarily wipe away any U.S. credibility in
18 encouraging non-nuclear states to stay that way.

19 I'm opposed to the BMDS because it would result in a
20 vast waste of money that could be spent on pursuing real
21 nuclear security, such as supporting the former Soviet
22 Republic in securing, controlling and decommissioning
23 their nuclear materials. Even the money spent giving the
24 Boy Scouts tours of hardware at Vandenberg Air Force Base
25 could be used by Russian scientists and physicists to help

1 protect us all.

2 Star Wars is a dangerous, destabilized and expensive
3 fantasy. Spend my tax dollars on something that will
4 protect me, my family and amphibians and the Boy Scouts
5 from ultimate environmental issue nuclear holocaust.

6 MR. BONNER: Jim Lingburg.

7 JIM LINGBURG: Thank you. Hi. I'm Jim Lingburg.
8 I'm the Legislative Advocate for the Friends Committee on
9 Legislation in California here in Sacramento. Thank you
10 very much for giving me a few minutes to address you all
11 here today. Excuse me.

12 Rather than extending the arms race into space is we
13 believe that the only way to reduce the threat of war and
14 violence is by addressing the social and material
15 conditions under which we live, reducing those inequities
16 that make war and terrorism attractive options. We spend
17 twice as much on militarization as the rest of the world
18 combined. Can we honestly say that has made us safer?

19 We were unable to stop 19 men with boxcutters. Since
20 1983 we've spent a hundred and thirty billion dollars for
21 missile defense. The Administration wants to spend 10
22 billion dollars this year. We have a letter from 49
23 retired military generals. If you go to the Center
24 for -- the Center For Arms Control of Non-proliferation,
25 if you go to their website, there is a letter from 49

1 retired military generals asking President Bush to not
2 spend this money on missile defense, to divert resources
3 to protecting our ports from weapons of mass destruction
4 that could make it into the country.

5 They also say U.S. technology already deployed can
6 pinpoint the source of a ballistic missile launch. It is
7 therefore highly unlikely any state would dare to attack
8 the U.S. or allow a terrorist to do so from its territory
9 with a missile armed with a weapon of mass destruction,
10 thereby risking annihilation from a devastating U.S.
11 retaliatory strike.

12 We would note that militarization consumes 50 percent
13 of our Federal tax dollars and our best scientists.
14 Instead of throwing money down a drain or black hole,
15 imagine what we could do if we had a Marshall Plan for the
16 planet. This is the only way to make the planet safer.
17 We need constructive, not destructive, solutions.

18 Diplomacy, disarmament and multi-lateralism as
19 opposed to unilateralism is the answer.

20 Thank you.

21 MR. BONNER: Darien Delu.

22 DARIEN DELU: I'm Darien Delu. I'm connected with
23 the Women's International League for Peace and Freedom,
24 the United States section. It's an honor to get to speak
25 to this body because of the other speakers who have come

1 before me, who have covered so many of the critical points
2 that have to be addressed in the Environmental Impact
3 Statement.

4 We have been presented with a document with 700 pages
5 of inadequate information and sidestepping and general
6 ignoring of the real issues involved. Many of these have
7 been raised already tonight and I'll try not to be too
8 redundant.

9 The -- NEPA provides for consideration of
10 environmental impacts of the MDA proposals. The MDA PEIS
11 finds only limited environmental consequences for the two
12 proposed alternatives. The so-called No Action
13 Alternative creates a straw dog against which to judge the
14 first two alternatives of the MDA.

15 The focus of my comments will be two-fold. First, I
16 call for a true No Action Alternative, as have others.
17 For example, or specifically, an alternative that goes
18 beyond the failure to integrate anti-ballistic missile
19 system to an alternative that rejects the individual
20 missile defense elements of a BMD System. Secondly, I
21 point out the unaddressed global environmental impact of
22 an accelerated arms race. Such acceleration, as has been
23 repeatedly pointed out this evening, is entirely
24 predictable as a consequence of the U.S. BMD program.

25 Because of the devastating impacts -- political,

1 environmental, ecological and psychological, as well as
2 merely environmental -- the impacts of a Ballistic Missile
3 Defense Program of any kind, this PEIS must address a true
4 No Action Alternative. The failure of this PEIS to
5 include such a true No Action Alternative violates the
6 requirements of the NEPA process. The absence of a true
7 No Action Alternative allows the PEIS to construct a false
8 comparison with the other alternatives underplaying the
9 different degrees of environmental damage.

10 According to the PEIS, the proposed action is needed
11 to protect the U.S. from ballistic missile threats.
12 However, the proposal as -- as a BMDS, a Ballistic Missile
13 Defense System in English, will result in an acceleration
14 of the global arms race.

15 As others have already pointed out, in the case of
16 China, if the U.S. implements a BMDS, other countries will
17 feel called upon to create or increase their missile-based
18 weapons deployment systems as well as their nuclear
19 armament in order to prevent -- in order to present
20 themselves as credible negotiation parties with the U.S.
21 and protect the survivability of their weapons.

22 As others have already pointed out, the PEIS fails to
23 address the chilling possibilities and associated impacts
24 of an accelerated arms race and its increased missile
25 testing. We're not even talking about the devastation a

1 war would cause.

2 And what about nuclear proliferation? The PEIS does
3 not address the many environmental impacts of the entire
4 nuclear cycle connected to nuclear proliferation. The
5 PEIS points out NEPA excludes from consideration the
6 environmental impact of a nuclear war or any acts of war.
7 But as human beings, we cannot exclude that in our
8 considerations.

9 MR. BONNER: Ellen Schwartz.

10 ELLEN SCHWARTZ: Good evening. I'm Ellen Schwartz.
11 I'm the Co-chair of the Sacramento branch of the Women's
12 International League for Peace and Freedom. And I thank
13 you for the opportunity to speak here.

14 We know from Gulf War I and the War on Terror and the
15 test results to date for the components of the BMDS that
16 the surgical precision with which U.S. weapons are guided
17 makes them excellent instruments for destroying embassies,
18 wedding parties and a hotels full of journalists. In
19 other words, you honored military gentlemen have trouble
20 hitting your backsides with both hands. If
21 you're -- there, is no way that a kinetic weapon -- is
22 that what you call it? -- hitting a missile with an arrow
23 is going to be able to actually hit any significant number
24 of incoming alleged threatening missiles. You're going to
25 have to use nukes in order to get a broad enough range of

1 destruction to take out any of these alleged incoming
2 threats from Alpha Centauri.

3 Are you going to test them? Are you going to talk
4 about them in the PEIS? Are you going to talk about the
5 environmental impact of testing nuclear weapons in the
6 atmosphere? Or are you just going to lie in the PEIS and,
7 you know, get it installed and say later, "Oops, we have
8 to have nuclear warheads"?

9 The display outside the hall finds uniformly no
10 significant impacts from any of the phases of the BMDS.
11 Emissions will be disbursed by the wind. It's unlikely
12 any animals will get in the way. Of course, no satellite
13 has ever fallen out of orbit and no rocket vehicle has
14 ever blown up on launch so there is no danger of anything
15 ever going wrong.

16 Even on your own terms without considering the
17 environmental impact of forcing China, Korea, Iran and
18 everybody else in the world to build their own systems to
19 protect themselves from ours, even without considering the
20 possibility that any of these countries including us might
21 use these systems, the BMDS is a disaster waiting to
22 happen. Every weapon built, sited, tested or even
23 decommissioned is a potential disaster.

24 Your three alternatives assume a program that is
25 going to be implemented whether we do whatever we say

1 here. And the PEIS and this hearing is nothing than a
2 legal formality. You have no true No Action Alternative;
3 only build it together or build it a little bit at a time
4 and don't test it together.

5 I'm a little offended that all you want to hear about
6 is the environmental impact of this system; whereas the
7 presentation talks about how we'll all be not safe if we
8 don't build it. If the safety of our country from our
9 alleged enemies is on the table, then so is the impact of
10 causing a war.

11 What you should do in your own terms is to consider a
12 true No Action Alternative, which is an analysis of the
13 relative emissions of greenhouse gasses and space debris
14 and toxic chemicals and radiation caused by either (A),
15 blowing things up or (B), pursuing broader implementations
16 of existing treaties, such as the Nuclear
17 Non-proliferation Treaty and the Anti-Ballistic Missile
18 Treaty, which would not produce any greenhouse gasses, any
19 space debris and would not blind any animal or destroy any
20 life on Earth.

21 Thank you.

22 MR. BONNER: Thank you. Marjorie Boehm.

23 MARJORIE BOEHM: I'm another speaker for the Women's
24 International League.

25 UNIDENTIFIED SPEAKER: The microphone.

1 MARJORIE BOEHM: I'm another speaker for the Women's
2 International League and I have the honor of reading the
3 statement that was sent to us by our president, Sandra
4 Silver.

5 The Women's International League is a
6 90-year-old-non-governmental organization that has worked
7 tirelessly since its inception to put an end to war. We
8 have supported the development of international
9 institutions and international law and non-violent methods
10 of conflict resolution that together could facilitate the
11 coexistence of diverse nations and peoples on this planet.
12 The MDA Draft PEIS seeks to answer to detrimental
13 environmental effects of three alternative development
14 plans.

15 We have found the answers disturbingly incomplete.
16 We have also considered all three alternatives presented
17 and have concluded that it would be dangerous and indeed
18 disastrous for the future of our nation to proceed with
19 any of them. It's impossible to comment on all of the
20 details but we will be submitting additional comments.

21 First, we are convinced that Alternative 2, which
22 includes the development of space-based interceptors, is
23 completely unacceptable. We will submit additional
24 comments on both the issue of debris from experiments with
25 space-based weapons and on the development of laser

1 weapons.

2 I'm skipping a little but -- and we have extra copies
3 of this report. So we'll be glad to share them with you.
4 We believe Alternative 1, which does not include
5 space-based weapons and Alternative 3, which is unclear on
6 this point, are also unacceptable.

7 Even from a solely environmental viewpoint, we're
8 concerned about the adverse effects in all of the resource
9 areas discussed in the PEIS, including hazardous waste,
10 legal restraint, decommission, destruction of the ozone
11 layer, global warming and rocket fuel solution.

12 We also wonder why this expensive and almost
13 certainly unachievable missile defense program has been
14 developed in the first place.

15 It does not answer to probable threat to our national
16 security in the present or in the coming decade. It will
17 do nothing to prevent terrorist attacks. And now there is
18 no hostile country or group with the capability of firing
19 intercontinental ballistic missiles at the United States.

20 Missile defense seems rather to be preparation for
21 future confrontation with the only two countries really
22 capable of threatening our current military domination or
23 challenging us with nuclear attack. Neither China nor
24 Russia is currently an enemy but this aggressive program
25 may well push them into organizing allies and forces

1 against our own threat of global and planetary domination.

2 MR. BONNER: Thank you. Ali Hosseinion.

3 ALI HOSSEINION: I'm Ali Hosseinion. I am an
4 American Iranian -- I'm an American Iranian and I'm really
5 scared in this country. Because this Environmental Impact
6 Report was really just like a third world country
7 Environmental Impact Report. They made it. They approved
8 it. And four locations in the United States are like
9 this, are gathering to say and voice their opinion. That
10 is really a shame. Hundreds of billions of dollars
11 spending and then only handful are here with no budget to
12 look at it and no time to oppose it.

13 Shame on me. Thank you.

14 MR. BONNER: Jeanie Keltner.

15 JEANIE KELTNER: I'm Jeanie Keltner, a Professor
16 Emeritus of English and editor of the progressive paper
17 here in town.

18 I'm sad to say I'm speaking with a deep sense of
19 futility today calling for a true No Action Alternative.
20 A deep sense of futility because I don't believe this
21 multi-billion dollar system can be stopped even by the
22 passionate, eloquent informed people in this room who have
23 come here on our own dime and our own time and spent many
24 dimes and many hours working for peace and better ways to
25 reconcile differences than the ones we see presented

1 tonight.

2 Too much money is going to too powerful entities to
3 be stopped by any citizen's group I'm sad to say. But
4 what has really struck me as we speak today is that we're
5 really speaking such different languages. How I wish that
6 we could communicate with each other because the
7 PowerPoint presentation was so far, so different from the
8 words that are being spoken here today in the room.

9 And how I believe that we are here all working for
10 what we conceive of as the greater good. And it is so
11 tragic that as we face the enormous challenge of global
12 warming and peak oil and ozone depletion that we're going
13 to waste the human capital and the financial capital on
14 this poisonous boondoggle that doesn't even work.

15 You know, we in Sacramento are surrounded by the
16 toxic mess the Department of Defense and its contractors
17 have left behind. And the U.S. Government has even
18 stopped cleaning up. The corporations long ago stopped
19 cleaning up. The U.S. Government has stopped cleaning up.
20 And I am certain that mothers have sat by the bedside of
21 dying children because of the chemicals those children
22 have ingested, the toxic cocktails. And that is not worth
23 anything.

24 So I just wish it could be different.

25 MR. BONNER: Jonathan Paatrey. Jonathan, you've got

1 two extra minutes given by Ms. Jaskowski.

2 JONATHAN PAATREY: First, I would like to --

3 MR. BONNER: Can you turn it on?

4 JONATHAN PAATREY: Is it off? All right. Thank you.

5 First, I'd like to thank you, Colonel Graham and
6 Mr. Bonner and Ms. Shaver and Mr. Duke for coming out here
7 and -- and presenting your material and then hearing what
8 the public has to share.

9 My comments are, I hope, going to be very specific
10 and germane to the PEIS. One of the things I want to
11 point out is that the -- our organization I represent is
12 the Physicians for Social Responsibility in Los Angeles.
13 We have about 5,000 members in Southern california. And
14 we have actually worked with Lenny Segal and I believe
15 you've heard his oral testimony as well as written
16 documents regarding the perchlorate and the lack of
17 information that is present in the PEIS.

18 Most notably, I would like to point out that the
19 timeline of potentially releasing the final document but
20 two weeks after the oral testimony, as well as what anyone
21 else could offer in writing and -- or even six weeks later
22 into -- in the end of January of '05 strikes me that you
23 very well may not take too seriously what we have to say.

24 I would strongly suggest that you factor a time when
25 you can actually take into account the things that the

1 public are suggesting.

2 I would like to offer some language for other
3 alternatives which would entail a great deal of work on
4 your part in the MDA office but I think it is absolutely
5 necessary.

6 You're clearly aware of the political decisions that
7 led to the formation of missile defenses, in general,
8 coming out of a decision politically that deterrents were
9 no longer sufficient. I feel that this Administration in
10 making that determination is mistaken. But in addition to
11 that, we haven't tethered out the differences in this
12 document between strategic defense defenses against
13 long-range missiles and those of an -- in a theater
14 defenses. And all previous administrations had kept these
15 two missile defenses segregated. And this Administration
16 has blended the two. And I think to the detriment because
17 theater defenses have actually a promising future, unlike
18 strategic defenses.

19 Theater defenses can protect troops in the field.
20 Theater defenses can protect cities from attack, overseas
21 especially. And they have actually enjoyed some limited
22 success both in the field of testing as well as in the
23 battlefield and also enjoys bipartisan support.

24 There is actually a realistic threat. There are
25 short-range and medium-range missiles that could actually

1 be fired in hostility at American targets or those allies;
2 unlike the strategic long-range missiles which do not
3 really have a basis in reality.

4 And in addition, theater defenses have a realistic
5 success because the boost phase of a missile is relatively
6 slow and even the descent of a short-range, medium-range
7 missile is much slower than that of the strategic missile,
8 which could be traveling at 10 kilometers per second,
9 which makes it very unlikely to hit.

10 The alternative, it may be politically impossible for
11 you to do this, but I think you should try to have another
12 alternative which would simply be to keep the -- this is
13 probably the presidential candidate John Kerry's position
14 on these matters -- would be to move ahead on theater
15 defenses but to maintain the strategic weapons that the
16 missile defense is -- against long-range missiles to be
17 held in research and development stage. And -- and that
18 would be my suggestion for a true alternative.

19 The other thing I want to bring up is in regards to
20 in the PEIS there is some statements in the effect that
21 some of the space-based interceptors would be placed in
22 geosynchronous orbit, which I believe is some 24,000
23 kilometers from Earth. To actually get a weapon from
24 24,000 kilometers out to what would be a low-Earth orbit
25 or even a lower trajectory of a missile within 20 minutes

1 or half hour and do so accurately and to hit the missile
2 is fantasy. And therefore I think the PEIS
3 mischaracterizes any weapon that would be placed in
4 geosynchronous orbit as being an anti-missile weapon. It
5 should simply not be listed as a possibility. That would
6 be -- well, you would be deploying an ASAT -- an
7 anti-satellite weapon. And you should go through the
8 process of actually fielding that before the public and
9 have -- and take your hits for that if, indeed, you're
10 doing that.

11 The same with the Airborne Laser. There is a very
12 good probability that an Airborne Laser would never work
13 in shooting down a missile in the boost phase and all
14 tests indicate that. But it could be highly effective in
15 a directed energy targeting on Earth for terrestrial
16 targets. And you should be honest about what that weapon
17 might also be used for. It would be helpful to actually
18 not mask the true purposes of some of these weapons.

19 I believe there needs to be more hearings. The PEIS
20 is insufficient in dealing with cumulative effects,
21 especially in Southern California, as so many of our local
22 contractors are working on the weapons systems. We're
23 bearing the brunt of our environmental impacts of the
24 laser weapon development and many of the rocket launches
25 and the rockets that are being assembled for those

1 launches to launch these 515 launches that may take place
2 over the next 10 years.

3 I also suggest that you get testimony from the
4 National Recognizance Office, if you have not done so.
5 I'm sure there are considerable concerns about military
6 recognizance assets being false -- being harmed by space
7 debris and --

8 MR. BONNER: Finish up.

9 JONATHAN PAATREY: Yes. Last but not least, I would
10 also suggest that you conduct a space debris analysis, as
11 you have sited in the PEIS, that there may be intercepts
12 as high a 400 kilometers. That either you do testing at
13 400 kilometers, which is ill-advised because of the debris
14 problem, but how would you know if the weapons work unless
15 you conduct the tests? Or you should actually assume that
16 the weapons won't work because you cannot conduct the
17 tests at 400 kilometers above.

18 Thank you very much.

19 MR. BONNER: Michael Monasky.

20 MICHAEL MONASKY: So this is a show, as we have
21 showstoppers. I'm confused. Well, actually, I -- I was
22 confused by the glossary. It's five pages long and single
23 spaced. And I haven't started yet.

24 The New York Times magazine two days ago asked
25 Wlodzimierz Cimoszewicz, Poland's Foreign Minister to the

1 United States about Polish defense minister, Jerzy
2 Szmajdzinski who recently announced plans to pull all 2500
3 Polish troops from Iraq next year. Cimoszewicz answered,
4 "It's not true. Our minister of defense mentioned that we
5 would like to end our mission at the end of 2005 but that
6 is not the official position of the government." But when
7 the Times asked Cimoszewicz if he had met with the
8 families of the 13 Polish soldiers who died in Iraq,
9 Foreign Minister had replied, "No. I have not." The
10 Polish government was officially represented by the
11 minister of defense.

12 Which begs the question: Has the defense minister
13 been demoted to coroner/chaplain or how many dead Poles
14 does it take to end the U.S. war in Iraq? Furthermore,
15 Polish Foreign Minister Cimoszewicz confirmed the Times
16 figure that 70 percent of Polish people oppose the U.S.
17 war in Iraq.

18 What are we afraid of? The Polish public opinion?
19 The so-called insurgent Iraqis taking up arms against
20 U.S. corporate mercenaries like Cal F. Brown and Root and
21 Halliburton? Ari Fleischer's so-called Operation Iraqi
22 Liberation? That was the original term for this attack,
23 O-I-L. Serves to liberate the resources under those
24 inconvenient civilians impeding corporate access.

25 The Cold War is over but this fact does not deter the

1 Bush crime syndicate from heating things up. There is no
2 peace dividend as it and any surplus saved in the 90's has
3 been spent since the start of the millennium. The world
4 is a decidedly more dangerous place because the Pentagon
5 has run amuck spending half of our income taxes while
6 mortgaging debt so far as our great grandchildren so it
7 can build so-called "kill vehicles."

8 Meanwhile, the Pentagon mocks our democracy. It
9 plans, tests, builds and imposes terrible weapons of mass
10 destruction. The Pentagon goes through the motions
11 pretending concern about the environment, holding meetings
12 in far away places like Alaska, Hawaii, where 61 people
13 appear; 15 speak forth; and 7 provide written comments
14 representing 280 million U.S. citizens.

15 Even the congressional "Millionaire Boys Club" does
16 not feign that kind of representative democracy.
17 The Pentagon does not even care about the speaking and
18 writing concerned citizens. Its Notice of Intent in the
19 Federal Register states the weapons system in question
20 will be used, quote, To defend the forces and territories
21 of the U.S. allies and friends against all classes of
22 ballistic missiles threats in all phases of flights.
23 Which, I suppose, makes the people of the U.S. potential
24 collateral damage.

25 I imagine the purveyors of the Pentagon portfolio

1 are like the characters in the Beatle's satirical song
2 entitled, "Piggies": Lying, conniving, consuming
3 everything in sight. They never see their evil behavior
4 inflict pain and suffering upon other beings and upon the
5 world. And to get their attention and change their
6 behavior, what they need is a damn good whacking.
7 Of course, the song is referring to spanking but the
8 Pentagon and spenders can measure its whacking in body
9 counts.

10 Here in California we analyze public projects and
11 hold them to the test of the California Environmental
12 Quality Act of 1970. When the Pentagon wanted to build a
13 biological nuclear and chemical testing, manufacturing and
14 storage facility at McClellan, UC Davis and Rancho Saco,
15 the community successfully challenged and stopped the bid
16 even before it could be tested by CEQA. The community saw
17 the proverbial writing on the wall. The plan was
18 analyzed. We found it wanting.

19 MR. BONNER: 30 seconds.

20 MICHAEL MONASKY: It amazes me -- I have to make a
21 comment, since you've decided to interrupt me here. I
22 speak before city councils and boards of supervisors and
23 they sit -- they sit up until 1:00 in the morning
24 listening to people like me talk who prepare comments. I
25 think it's extremely rude for you to stand there and time

1 us when we've prepared our comments and we've thought this
2 through.

3 You might have come from Fairfax, Virginia but you
4 know, I'm sorry if I cut into your tee time or anything.
5 So I'm going to finish. I have two more pages.
6 But I'd appreciate it if you would stop interrupting my
7 comments and those others who have worked all day, like I
8 did, and came here.

9 MR. BONNER: You're cutting in to the time of the
10 others. There are ten other speakers.

11 MICHAEL MONASKY: No. No. We're cutting into your
12 time. This is not the time of others. This is the
13 others. We are -- are the others. We are the people and
14 we're speaking here, sir. Let me finish without
15 interruption.

16 Did I get to the spanking?

17 The body counts. Yes. Thank you. And I talked
18 about the California Environmental Quality Act, of which I
19 think is great -- well, I think it's good to have an
20 Environmental Quality Act. It's weak but nonetheless it's
21 there. Let me pick up where I was at. Here.

22 Anyway, the community saw the writing on the wall.
23 The plan was analyzed and it was dropped but this -- the
24 same is true of defending BM's. This PEIS reads like a
25 negative declaration.

1 In case you have not heard, the Cold War is over.
2 This is reason enough for the No Project Alternative CEQA
3 style. It's time for demilitarizing the Pentagon. I'm
4 partial to Helen Caldecott's suggestion that it be
5 converted back to its original design as a hospital.

6 I recommend we just skip the testing, manufacture and
7 storage steps for these weapons systems that are referred
8 to in this EIS and cut to the quick and decommission them
9 all. Take out their fuses and timers and igniters and
10 hire clever chemists to convert their horrible toxins to
11 safe use.

12 Further, since adults seem to muck things up in the
13 State Department, we should pay and support a coterie of
14 children as ambassadors of peace and reconciliation to all
15 countries on Earth. No more foreign aide. No more
16 foreign debt. The kids will figure it out from there.
17 The spanking should continue upon Pentagon contractors
18 until they change their behaviors. Meanwhile, rescind all
19 Pentagon weapons contracts. No more bucks for bombs.
20 The reason why the Pentagon thinks it needs these weapons
21 systems is because the United States of America has
22 neither learned how not to over consume the planet's
23 resources or stop exploiting human labor. We must become
24 men and women of conscience who believe in and practice
25 trust and respect for one another.

1 The No Project Alternative, as in CEQA spares us and
2 our planet's ecology while allowing our energies to be
3 spent on truly productive human endeavors.

4 No showstoppers, eh? So this is a show. This PEIS
5 is a non-responsive negative declaration.

6 Thank you very much for your time.

7 MR. BONNER: Just to clarify, we're willing to stay
8 here as long as you like.

9 UNIDENTIFIED SPEAKER: We came here on our own time.
10 We payed our own fare to get here. I came from far away.
11 Many came from far away. You are paid to be here. You
12 got your fair pay to be here. You're put up by the
13 government. We are not. Therefore, I think you should
14 listen to us.

15 MR. BONNER: That is the purpose of this meeting.
16 The reason for setting the time limits is not to restrict
17 comments. The reason for setting the time is to respect
18 your time and the time we have here. We're willing to
19 spend as much time as you want to get your comments out.
20 That is the reason behind the three minutes.

21 Leonard Fisher.

22 LEONARD FISHER: I'm Dr. Leonard Fisher, retired
23 faculty member of medicine at UCLA and volunteer physician
24 at the LA Free Clinic and a member of Physicians for
25 Social Responsibility. I'm one of the groups that drove

1 through the rainstorm this morning to get up here so we
2 could express our concerns about what is going on.

3 I'm going to limit it to the problems related to
4 ground-based interceptors. The most tested but still
5 woefully ill-performing technology to develop to thwart
6 long-range ballistic missile attack is out of the
7 midcourse interceptor. This weapons system is designed to
8 intercept enemy missiles in space from ground platforms in
9 Fort Greely, Alaska, Vandenberg Air Force Base in Southern
10 California. The chemicals used in solid rocket propellant
11 that would be used to launch the intercept missiles, the
12 test missiles and especially the booster rockets that
13 place related detection communication satellites in space
14 would all use ammonium perchlorates as the oxidizing agent
15 in the rocket fuel. The fuel would also contain highly
16 toxic hydrazine compounds and nitrogen oxide.

17 In the news of late, the developmental toxin
18 perchlorate has been found in many of our nation's
19 drinking water sources. This chemical inhibits thyroid
20 hormone creation and release. In low doses, perchlorate
21 is presumed to decrease the intelligence potential of a
22 developing fetus. In cases of more severe exposure, can
23 cause frank retardation.

24 Additionally, once combusted and exposed to air
25 moisture, perchlorates create hydrochloric acid, more

1 commonly known as "acid rain."

2 Further, rocket launches deliver hydrochloric acid in the
3 upper atmosphere, which, in turn, chemically interact with
4 the protective ozone layer. It is therefore fair to
5 assume that an increase in rocket launches may
6 correspondingly bring about additional cases of skin
7 cancer.

8 Rocket fuel needs to be continually replenished. The
9 disposal of solid rocket propellant through washing out,
10 propelling or open burning, open detonation are some of
11 the major sources of perchlorate contamination across the
12 country.

13 None of these perchlorate-related issues are
14 adequately addressed in the PEIS. I'd like to add one
15 further comment regarding the meetings that have been
16 held. Southern California is bearing a disproportionate
17 impact of missile defense development and its effects on
18 the environment. The midcourse interceptor is being
19 tested and deployed at Vandenberg Air Force Base in Santa
20 Barbara County.

21 The Airborne Laser is being tested at Edwards Air
22 Force Base in Los Angeles County. The space-based and
23 Airborne Lasers are being developed by Northrop Grumman in
24 the South Bay and San Juan Capistrano. Lockheed Martin,
25 Boeing and Raytheon are deeply involved in developing the

1 midcourse interceptors and other systems.

2 At a minimum, there should be additional hearings
3 near the areas most effected by missile defense
4 developing. There should also be an environmental health
5 evaluation concerning cumulative impacts for military
6 production, testing and deployment of missile defense
7 systems compounded on top of past military use.

8 This evaluation should be done with an eye on
9 disproportionate impacts on low-income communities of
10 color.

11 Thank you.

12 MR. BONNER: Philip Coyle.

13 PHILIP COYLE: I'm Philip Coyle. I'm also from Los
14 Angeles. The environmental process --

15 MR. BONNER: Raise the mic.

16 PHILIP COYLE: Is this better? I'm Philip Coyle.
17 I'm also from Los Angeles. The environmental process
18 described in this PEIS is not believable or trustworthy
19 because the statement read by Mr. Duke tonight is already
20 not being followed. Mr. Duke said if testing failed to
21 show the system worked, the system would not go forward.
22 But as we know, the system is already being deployed even
23 though it has no demonstrative capability to work under
24 realistic conditions.

25 To take a different example, the PEIS says and, I

1 quote, The Airborne Laser is currently the
2 only -- emphasize only -- proposed BMDS element with a
3 weapon using an air platform, closed quotes. However, the
4 PEIS does not discuss another proposed BMDS element that
5 would use air platforms; namely, interceptors fired from
6 aircraft.

7 With respect to the No Action Alternative already
8 mentioned by others, it does not describe a scenario where
9 no action is taken. Rather, it describes a system where
10 the Missile Defense Agency would continue existing
11 development and deployment unabated under the No Action
12 Alternative. And I quote the PEIS here, Individual
13 systems would continue to be tested but would not be
14 subjected to system integration tests, closed quotes.

15 This is hardly no action and allows for indeterminate
16 missile defense program since -- to go back to quoting the
17 PEIS, There are currently no final fixed architectures and
18 no set operational requirements for the proposed BMDS,
19 closed quotes.

20 Thus, even if MDA agreed to the No Action
21 Alternative, it would not find its actions constrained for
22 the foreseeable future.

23 And, finally, with respect to space-based
24 interceptors, the PEIS is silent about the fact that
25 missile defense would, for the first time, weaponize

1 space. While space is certainly militarized, it's not yet
2 weaponized; that is, with attack weapons in space and with
3 the chain reaction of a new arms race in space.

4 The PEIS does not adequately address the
5 environmental impacts of the consequences of placing
6 strike weapons in space.

7 Thank you.

8 MR. BONNER: Lara Morrison.

9 LARA MORRISON: I'm here from Los Angeles and my
10 background is in bioethics and environmental science. And
11 I feel like the PEIS provides an inadequate assessment of
12 the environmental impacts. It does not allow the reader
13 to compare the magnitude of the potential impacts or the
14 degree of risks involved with the alternatives and with
15 the elements of testing, deployment or not acting.

16 The proposed system will promote a false sense of
17 security while preempting the use of resources to address
18 real threats, global warming and peak oil.

19 According to the report on winning the oil end game
20 from the Rocky Mountain Institute and the Pentagon, the
21 U.S. could eliminate our dependence on oil by investing a
22 hundred and eighty billion over ten years.

23 Dennis Hayes advocates investing 30 billion in
24 implementing solar power over five years as a way of
25 addressing energy problems and reducing the chances of

1 global warming.

2 These two proposals would greatly improve our
3 security and the health of the planet for less money than
4 is planned for the Ballistic Missile Defense System, which
5 is between 800 and 1200 billion dollars over 15 years.

6 Also, this impact assessment does not address the
7 potential threats of these weapons falling into the hands
8 of terrorists. And I think that that is really a
9 significant issue. If we don't develop, they cannot fall
10 into the hands of terrorists. If we do develop them, they
11 can. And particularly since the scope of this project is
12 to have different elements deployed throughout the world,
13 and we can't be on top of every local deployment area all
14 of the time, it greatly increases the chance that
15 something like that could happen.

16 Thank you.

17 MR. BONNER: Stephen Gonzalez.

18 STEPHEN GONZALEZ: How you all doing? As you said,
19 my name is Stephen Gonzalez. I'm a resident of planet
20 Earth. I think that is really about all that needs to be
21 said about where I live.

22 As the subject matter of the defense system covers
23 the whole planet, as is implied by the neat charts and
24 graphs, it does not -- that is kind of a given -- what I
25 find amazing is that the biggest issue is that they've

1 seen the need to integrate a system against a localized
2 threat. Yet the threats to the implementation of the
3 system are not taken holistically; i.e., well, we'll worry
4 about a site-by-site assessment of the environmental
5 impact threat. If you're going to impact the water in one
6 place, it's going to impact the water somewhere else, too.
7 Shouldn't we be tying the threats to the system
8 showstoppers -- which I still don't know what they are?
9 What would -- I -- I'd like to know what would have given
10 these people a red flag to say maybe we shouldn't do this?
11 It's not the depletion of the environment or public health
12 or pissing people off around the world. Those aren't
13 showstoppers. I'm scared to know what the showstoppers
14 are to them. Must be pretty major, like the whole
15 atmosphere lighting on fire. Is that a showstopper?
16 You know, I mean, laughter is good. You know, I wish
17 I -- it was that funny actually. I have just -- I want to
18 bring to the attention of everyone here that it's good
19 we're here but we need to talk to other people. Someone
20 brought up the issue of communication. We're not talking
21 about the same issues of defense. What is a defense to
22 us? What is a threat to our safety? I'm a lot more
23 concerned right now about dying of asthma than I am of
24 Osama Bin laden. I can feel my lungs collapsing every
25 day. I can smell it in my water. I can't see the

1 mountains. And that was not brought by a terrorist. None
2 of those effects were brought about by terrorists or
3 weapons of mass destruction.

4 You know, these -- the very process by which we're
5 protecting ourselves are creating the greatest threats to
6 our security. At some point that has to be evaluated.
7 This whole system is really about a very specific threat
8 from a very specific place. This is about choosing a
9 style of conflict, choosing a path of conflict that
10 they've decided is the best way they can win of all of the
11 scenarios of direct conflict engagement or technological
12 engagement. They've decided this is the best way.

13 You know, I -- I'd like to think there isn't a
14 conflict that is predetermined. I would like to think
15 there is still some hope for diplomacy and such that
16 they've got it planned out we're going to eventually fight
17 somebody. I'll leave you to wonder who.

18 Don't be afraid to talk to people.

19 MR. BONNER: Stella Levy.

20 STELLA LEVY: Thank you to everyone who has spoken so
21 far. I think it's been -- I have learned so much and I
22 feel like I really understand a lot more than I did when I
23 came in. There is not very much really that I can add to
24 a lot of the things that have been said because I don't
25 have the particular expertise.

1 I'm a local attorney concerned with human rights and
2 peace. And so one thing I thought I might address is
3 something that was alluded to by several of the speakers
4 and that has to do with the process we're involved in
5 here.

6 As an attorney, that is something we're always
7 concerned about is process. At first when I first heard
8 about the hearing and when I came here and saw all of the
9 nice exhibits you had put up, my first impulse was this is
10 really cool -- you know, this is really nice and how nice
11 we've all been invited. But now I don't think so anymore
12 because I'm noticing that there were only four locations
13 at all where public testimony has been invited: Virginia,
14 Sacramento, California, Hawaii and Alaska. That seems to
15 me to be not nearly enough public input. That point has
16 already been made.

17 I would like to talk about Exhibit ES-3, which is
18 part of the Executive Summary. If you want to go along
19 with me, that exhibit shows the effected environment.
20 This is about environment that we're talking about here
21 today. I looked at that to see what the affected
22 environment was. All of the environment that can be
23 affected is divided into nine biomes, as well a broad
24 ocean area and the atmosphere. I went through that and I
25 saw the following. I saw that we're talking about the

1 Arctic regions, North Atlantic Ocean, Pacific Ocean,
2 Alaska, Canada and Greenland. Then some more Arctic
3 regions and also Alaska, deciduous forest and Eastern and
4 North Western U.S. and Europe, Chaparral. That is
5 California Coast, Mediterranean from the Alps to the
6 Sahara Desert, from the Atlantic Ocean to the Caspian Sea.
7 This is a lot of area here. And these are areas that are
8 labeled as "affected areas." Oh, the Grasslands. That is
9 the whole prairie of the Midwest. The desert. Oh, the
10 arid Southwest. New Mexico, Arizona, Utah and the Rocky
11 Mountains, as well as the Alps, Pacific Equatorial
12 Islands, which I don't know. Maybe that is why we're
13 going to be in Hawaii. Northern -- you've got to turn the
14 page. Northern Australia. And then how about the broad
15 ocean area. That has no particular latitudinal range and
16 that's the Pacific, Atlantic and Indian Ocean. And then
17 the really big one, the atmosphere, which is the
18 atmosphere which envelops the entire earth.

19 That looks to me like a global environmental impact.
20 And it seems to me only fair and some kind of rule that I
21 think is codified in lots of different places that the
22 people that are effected by legislation and -- and
23 programs get to talk about it, get to respond.

24 Well, that is going to be a lot more than the people
25 in the U.S. Even if you say four hearings is enough in

1 the U.S. --

2 UNIDENTIFIED SPEAKER: Who said that?

3 STELLA LEVY: Who said it? Nobody. I did not say
4 it. Even if you do, this is a global environmental
5 impact, this Star Wars Program. And, therefore, I'm not
6 impressed with the hearing anymore. I think four is
7 completely minimal. And so I would like to take the
8 remainder of the time, if you would allow me, to make some
9 suggestions of things that maybe other people might want
10 to add, things that we might be able to do and do a little
11 organizing here; which is, first of all, I think it would
12 be entirely appropriate if you -- anybody who knows anyone
13 and has connections, friends on legislation, which I'm a
14 big supporter, lawsuits -- I think some lawsuits are
15 called for for the reasons that were explained, which is
16 the Environmental Impact Report is really inadequate and
17 does not -- does not meet basic legal requirements.

18 I think that would be a very good thing to do. You
19 should get ready for that and -- Colonel -- and another
20 thing too is there are a number of people here
21 representing different organizations, Physicians for
22 Social Responsibility, FCL has -- there is also Friends
23 Committee on National Legislation, different groups and so
24 forth. Different groups. I think really we can get the
25 word out through our emails and so forth about this.

1 And I'm also concerned about contacts in Europe for
2 those like WILPF, for instance, which is an international
3 organization or any international organization,
4 Greenpeace, whatever, that you belong to because I think
5 that people in Europe, Australia and so forth have a right
6 to know about this and to have the same information that
7 we have. And people may have other ideas.

8 Now, just a little personal note here. My son lives
9 in Southern Switzerland in the Canton of Tacino. He
10 married a woman who is teaching. I'm going to let them
11 know. I saw the Alps are in here. They're in the
12 southern Alps. And I know that when I've gone to visit
13 them, I can tell you those "pace" flags are hanging all
14 over the place. People there really care about peace.
15 They were part of a demonstration in Milan that was
16 humongous. And I think there would be a lot of concern
17 and there should be a lot of concern.

18 I really think it's unfair to put a Star Wars system
19 into place and not allow people who will be affected to
20 weigh in on that matter.

21 And I guess my final suggestion would be to vote for
22 change of Administration.

23 MR. BONNER: Byron Diel.

24 BYRON DIEL: I'm Byron Diel. I'm a paramedic and
25 music activist. I'm representing Peace Fresno and the

1 band, Superfluid Helium 3. I'm going to address my
2 comments given the possibility, however unlikely, that the
3 system would actually work and that it's not just a big
4 pork barrel corporate welfare project. Let's leave that
5 large probability temporarily aside.

6 As the Bush doctrine of pre-emptive war required a
7 concrete demonstration -- case-in-point being the invasion
8 of Iraq -- the breaking of the ABM Treaty and the
9 consequential bringing of the real war into the theater of
10 space also requires a concrete example of which I believe
11 Alternative 2 to be the -- the prototype.

12 And while I'm not generally a betting man, I would
13 speculate that Alternative 2 is a foregone conclusion and
14 that we're currently engaged in a process of a
15 pseudo-imitation democracy and pacification of the public.

16 Alternative 2, I believe, to be a Trojan horse of
17 sorts, given the facts the openly stated intentions of the
18 authors of the project for the New American Century work
19 and the Vision for 2020 and other similar documents are to
20 create full spectrum dominance; first, by negating the
21 threat of deterrence and increasing the perceived virility
22 of our own nuclear arsenal by illuminating the threats of
23 being shot back at.

24 Then to move on by actually creating space-based
25 offensive weaponry and then to deny access to space for

1 other nations. The threshold being crossed by Option 2 is
2 a veritable Pandora's Box, moving the militarization of
3 space from the purely informational level to actual
4 weaponization.

5 And the true environmental impact of such a threshold
6 of crossing, I believe, must be examined on a
7 multi-generational basis, given the dangerous precedent
8 being set.

9 That is it.

10 MR. BONNER: Michael Comer.

11 MICHAEL COMER: I'd like to use this one if I could.
12 Well, I apologize for what could be considered
13 inappropriate attire. I came straight from work.

14 My name is Michael Comer. I live in Carmichael.
15 I'm -- in the interest of full disclosure I am a member of
16 the Sacramento Area Peace Action but I'm not here speaking
17 as an official representative of that body.

18 First of all, I'd like to point out that there is a
19 serious misnaming of this project, as far as it being
20 missile defense. Missile defense is actually the linchpin
21 of an offensive first strike capability.

22 I find it curious that George Bush has ordered the
23 deployment of this system without comprehensive testing.
24 Perhaps the reason is that the system would not likely
25 pass that testing. I think if you talk about the missile

1 base system, it's really helpful if you have -- what do
2 you call it? -- a transponder or some kind of a beacon in
3 the target you're trying to hit.

4 So in all likelihood, the missile-based system will
5 fail or at least be considered to be inoperative, which
6 means it would be required to move on to the next phase,
7 which I heard referred to -- basically the character of
8 that next phase would be a satellite network surrounding
9 the Earth. These satellites would be a base for laser
10 weaponry. It has to be considered what would be the power
11 source that could power a laser that could be strong
12 enough to take out a missile or a land-based target. That
13 would be nuclear power.

14 So if you want to consider environmental impact,
15 we're going to have launches of missiles with nuclear
16 materials aboard. If those missiles fail, we'll have
17 nuclear material raining back on us. If a satellite is
18 successfully launched and it falls out of orbit, it will
19 be bringing back to Earth nuclear materials. I have not
20 heard any of these issues addressed in the Environmental
21 Impact Report.

22 I actually -- I think I pretty much have no more to
23 say than that.

24 Thank you very much.

25 MR. BONNER: Winnie Detwiler.

1 WINNIE DETWIELER: My name is Winnie Detwieler. I'm
2 here on behalf of Sacramento Area Peace Action and our
3 4,000 plus supporters, both to comment -- both to comment
4 on the PEIS and to register a complaint with the manner --

5 MR. BONNER: Let me turn this off. I can get the
6 other one for you.

7 WINNIE DETWIELER: Okay. I'm here on behalf of
8 Sacramento Area Peace Action and our 4,000 plus supporters
9 here, both to comment on the PEIS and register a complaint
10 in which the manner in which the hearing has been
11 scheduled.

12 There's been no widespread publicity in California
13 that we're aware of regarding this hearing today in
14 Sacramento. Is this some sort of the stealth strategy to
15 limit public input on such critical issues. The question
16 is: Can the Draft PEIS be legitimate if there is not
17 adequate notice of the document in the hearings on this
18 matter?

19 What is most disturbing, however, is that the current
20 Administration is forging ahead with components of the
21 first two interceptors for the BMDS, making a mockery of
22 these hearings. It's even more perplexing that the
23 interceptors were just installed and had not been tested
24 in the system. The tests have been continually postponed
25 and the Pentagon's Chief Weapon Evaluator has said the

1 interceptors may only be capable of hitting their target
2 about 20 percent of the time.

3 Why is our government spending billions of dollars in
4 risking the beginning of a nuclear arms race on a
5 so-called missile shield with such an abysmal record?

6 The greatest danger we face is not some
7 intercontinental ballistic missile carrying nuclear
8 warheads to our shores; but are reigniting nuclear arms
9 race and motivating countries that fear us to attempt
10 illegal acquisitions of nuclear weapons. They see the
11 technology for our Missile Defense System can also be used
12 offensively against them. Their defense against our
13 military superiority would be to either produce many
14 nuclear ballistic missiles to overwhelm our 20 percent
15 system or to use secret delivery system weapons smuggled
16 into our country or delivered by short-range missiles
17 launched just off shore.

18 Forging ahead with the missile defense system will
19 create terrible consequences from pollution from rocket
20 launches, space debris and accidents within the system or
21 involving civilians.

22 Other groups are scheduled to testify more
23 comprehensively on this environmental hazard. But I'm
24 emphasizing here all people on Earth, not just Americans,
25 face grave environmental threats from this drive to

1 dominate the world by dominating space.

2 The environmental pollution may kill us slowly if we
3 don't do it quickly with a nuclear war. But the greatest
4 environmental impact will be to make the entire planet
5 more dangerous to all forms of life and we Americans more
6 vulnerable and not safer.

7 Most Americans consider nuclear war unthinkable; but
8 apparently our leaders in Congress do not. It is
9 astounding to see the turn around on proliferation and new
10 nuclear weapons in this Administration.

11 Will threatening other nations encourage them to
12 cooperate with a non-proliferation treaty? Will the U.S.
13 violations of the treaty persuade other nations to embrace
14 non-proliferation? We think not.

15 Similarly, the abrogation of the Anti-Ballistic
16 Missile Treaty last year by this Administration in order
17 to pursue this fantasy missile shield will not promote
18 international cooperation on disarmament.

19 We can only conclude that this rush to further
20 develop and deploy this ill-conceived missile defense
21 shield is driven by ideology and politics and fueled by
22 the greed for profits from this costly boondoggle. That
23 is what it is, a boondoggle.

24 The leading scientists and Nobel Prize Laureates have
25 condemned this as irrevocable and dangerous to global

1 security. But this Administration rushes headlong into a
2 hasty deployment. The term coined to characterize this
3 drive is a "rush to failure."

4 In conclusion, we at Sacramento Area Peace Action
5 condemn the Alternatives 1 and 2 with extreme threat
6 proposed on our nation and the world. We would support
7 the No Action Alternative if there had been a legitimate
8 attempt at researching and weighing a true alternative of
9 no action. Such a proposal should have encompassed a
10 suspension of research and development, no testing and no
11 initial deployment. It should have evaluated the cost
12 effectiveness of vigorous pursuit of international
13 cooperation on nuclear disarmament.

14 As it stands, the No Action Alternative does not meet
15 the requirements of the National Environmental Policy Act.
16 For this reason, we consider the Draft PEIS inadequate and
17 insufficient for proceeding with the BMDS.

18 MR. BONNER: Is Rick Thomas still here?

19 RICK THOMAS: Yeah. Good evening, sir. Good evening
20 ma'am. Evening all. I drove up from Fullerton, Southern
21 California through a blizzard coming from Reno. Long
22 story. And I've come to make some comments and I've come
23 to ask a few questions.

24 I'd like to endorse most of the things I've heard
25 here; not all, but most. I work as an addiction

1 counselor. I'm a Veteran. I don't -- I don't get to work
2 with what you would calling a fun bunch of folks
3 sometimes. But one thing I have found is that when I'm
4 angry or when they're angry, people don't hear. I believe
5 there is a lot of stuff here to be angry about.

6 One of the things I'd like to say is that one of the
7 things that leads to addiction is family disfunction. And
8 family disfunction often takes place with very good
9 intentions. I'm sure these gentlemen who came here
10 tonight to listen to us have good intentions.

11 Somebody asked earlier, "Where are the people?" I
12 would guess that a lot of them are either at home
13 unwinding from a ten-hour day, trying to make ends meet.
14 Or they're at work at their second job in order to help
15 the kids gets clothes so they can go to school. Yeah, I'd
16 like to say we need more meetings about this. I'd love to
17 see more people involved in this.

18 First point, addiction counselors work with overflow
19 emotions. We can laugh or we can cry. Those are the
20 overflow emotions. It is easy, I think, sometimes to
21 laugh at the silliness of some of the stuff. Yeah, if we
22 spend another 250 trillion dollars over the next decade
23 we'll really be safe. How silly is that?

24 I think we can give checks to every -- everybody in
25 the Middle East and be much safer with that amount of

1 money myself. Everett Dirksen -- Everett Dirksen, he had
2 a line that said, "A million here, a million there.
3 Pretty soon you're talking about real money."

4 The thing I'd like to say about that is that if this
5 money was used for pure research, that would be fine with
6 me. But what I see happening here is that this money goes
7 towards an in-process research, which we've already heard
8 from a lot a folks more articulate than I -- a Nobel
9 Laureates, scientists, retired people -- saying this isn't
10 going to work in the long run.

11 I'd also back up a point made earlier about
12 geosynchronous orbit. I was involved throughout the 80's
13 with a thing called High Frontier. Former Princeton
14 professor, Gerard K. O'Neill, he said that if we would use
15 this money that we bandy about so much like we used with
16 NASA, the money that the government put into the NASA
17 program throughout the 60's and 70's, created technologies
18 and investments in the private sector \$7 for every \$1
19 invested at the Federal Government level.

20 I don't see how this program could create this in the
21 private investments. I think if we talked about putting
22 space stations up like Gerard K. O'Neill talked about
23 that would be a much better way to get something going up
24 there.

25 Lastly, a reporter once asked Mohamed Ghandi what he

1 thought of Western Civilization. His answer was, "I think
2 it's a great idea." And I think it's a great idea, too.
3 And I think if we can maybe reach across the aisle a
4 little bit and get down to some of the more human things
5 we're both looking for, maybe there is a way we can work
6 this stuff out.

7 Nelson Mandela in his inauguration speech -- and I
8 loved it -- he said, "I'm only running once. That is it."
9 In his -- in his inauguration speech -- I get choked up
10 talking about it -- he said, "After 27 years in prison I
11 firmly believe that it is no longer man's worst that we
12 fear the most. I firmly believe it's man's best that we
13 fear the most."

14 So what I have here to ask tonight is: Where is our
15 best in this? Where is our best in this? Can't this
16 money be spent better for your kids, for your family? For
17 your kids, for your family? For these people's families?
18 My God, what are we doing? What are we doing?

19 Thanks for your time.

20 MR. BONNER: Fawn Hadley.

21 FAWN HADLEY: Hi. My name is Fawn Hadley. I hadn't
22 intended on speaking tonight but I was inspired so I'm
23 mostly going to read. I'm really glad I got to follow the
24 gentleman I just followed.

25 My background is in philosophy and I work in a girls'

1 group home. And I see the family disfunction and how it
2 affects those people everyday as well.

3 I've spent the first half of my life understanding
4 why I self-sabotaged. I've gone to courses that have
5 helped me to learn that I could not fix a problem with the
6 same mind that created it, which is what Einstein said.

7 We have programs now that have technology that can
8 actually change the way that we think. We have to choose
9 that. It's a choice we have to make. But we can actually
10 change from a victim mentality to a very powerful
11 mentality in taking responsible for our actions. This
12 kind of technology is also available in Israel and
13 practiced on a regular basis all over the world through a
14 program called Landmark Education. There is also a
15 program called the HeartMath that teaches thinking through
16 the heart, as opposed to strictly through the head.

17 There is a book that was written by a man named
18 Goleman called Emotional Intelligence. And he -- he took
19 his book from a program -- I can't remember if it's Life
20 and Mind or Mind and Life. I think it's Life and Mind
21 Institute, which is the Dalai Lama and the U.S.
22 universities' psychology programs. They come together
23 once a year for a week, I believe, to try to understand
24 how we can become emotionally intelligent.

25 We have to look at how thinking should be our most

1 powerful resource. We can change how we think. I told
2 you, I'm kind of skipping around a little bit. We have
3 more power in our minds than a ballistic missile.
4 Einstein, Galileo, Max Planck, to give a few examples.
5 Taking responsibility for who we are and what we've done
6 to people is the fastest icebreaker you'll ever find. If
7 someone takes responsibility for something that
8 they've -- that they've done to you, it's really hard to
9 fault them; if they have from the heart taken
10 responsibility. You -- it's a natural communication
11 opener. It just automatically connects your humanness
12 when somebody takes responsibility for doing what they've
13 done. And I don't see that going on in our life very
14 much, in our world very much but it's possible.

15 If you think I'm in a fantasy world, I'm in the same
16 group as Max Planck and Albert Einstein, only on social
17 issues. Let's vote an emotionally intelligent human into
18 office. There are -- each one of us has an opportunity
19 with every interaction we have with every person to spread
20 that kind of integrity and communication with other
21 people.

22 The programs I mentioned earlier, Landmark Education
23 and HeartMath both have websites. There is also a man
24 named Gregg Braden, who was first a geologist, I believe.
25 Then he worked in the Defense System. Then he worked for

1 SYSCO System Computers. And he has -- for the last 12
2 years he's traveled around to monasteries and such and
3 done research on our human past and what has led us to
4 where we are today. Very interesting man. He also has a
5 website, Gregg Braden. He also has a book called The
6 Isaiah Effect and the last one was the God Code.

7 Responsibility and communication unites us. I think
8 that is it. Hope I haven't confused anybody.

9 MR. BONNER: Caroline Schmidt.

10 CAROLINE SCHMIDT: I wasn't going to speak either but
11 I just wanted to thank all of the people who inspired me:
12 Pallo Deftereos and Winnie Detwieler. They've made me
13 more aware than I ever have in my entire life of what is
14 going on around me. Through those organizations we're
15 going to do another nuclear forum next year, try to get
16 the universities, try to speak to the students who are
17 coming up.

18 And when I looked at her writing, I thought maybe she
19 was the Sac Bee. Well, the Sac Bee was invited a couple
20 of times. And Mr. Mort Salisman is going to hear from me
21 tomorrow because I do not understand why the Sac Bee would
22 not be here to write to get the people to know what is
23 going on, to gather us together to get forces behind us.
24 It needs to be done.

25 In a little joke on the refrigerator where a man is

1 standing on stage and he's asked to play a concerto. He
2 says, "Don't make me come down there" to the audience.
3 I'm going to go down there. I don't know how successful I
4 will be. But maybe if everybody who lives in Sacramento
5 will call Mr. Mort Salisman and leave messages on his
6 machine and ask him why nobody was here and why Channel 3
7 and Channel 10 didn't come either.

8 I don't know what they're doing but I know -- I don't
9 know. I don't think so because they checked the list.
10 When I hear all of you speak so heartfelt and so glorious
11 about how you feel about this country and what the right
12 thing to do is, I'm in the right neighborhood. And
13 whoever gets in office next time, we have to watch them
14 like a hawk.

15 Thank you very much.

16 MR. BONNER: That is the end of the list of folks who
17 signed up to speak. I'd like to offer an open invitation
18 if somebody hasn't spoken and they'd like to take the
19 opportunity.

20 Please, if you could give us your name and if you
21 have an affiliation, that would be helpful.

22 HARRY WANG: My name is Harry Wang. And I'm a
23 physician and a member of PSR Sacramento, Physicians for
24 Social Responsibility. I did sign up and I guess my name
25 got overlooked. I know it's getting late.

1 I believe in the separation of church and State,
2 especially these days. I also believe in the separation
3 of science and State. And I think this has been an issue
4 for our current Administration because I think a lot of
5 our science has gotten politicized in many, many different
6 areas. I also question if the PEIS provides objective
7 scientific information upon which to really base a
8 decision.

9 I realize that there is a law passed by Congress, a
10 mandate from the government to go ahead with the Ballistic
11 Missile Defense System. But if you're really going to
12 look at the science of the environmental impact, I don't
13 think -- I don't think it's sufficient, this information
14 provided.

15 I also, you know, agree with many of the comments
16 already made about concerns about toxic pollutants,
17 particularly perchlorate concerns about the debris in
18 space.

19 But these are just -- these are agonizing times for
20 all of us in the public. It's agonizing because of the
21 decisions that our government is making. It's agonizing
22 seeing how our moneys are being spent. It makes us wonder
23 if the need of our citizens are really being looked at,
24 whether they take priority compared to other agenda items.

25 For example, this year the government allocated 40

1 million dollars to try and come up with a new influenza
2 vaccine. As we all know, we have a terrible shortage of
3 influenza vaccine. It's a long process of four, five, six
4 months to develop a vaccine. The government properly
5 allocated funds to come up with a more efficient way to
6 come up with a vaccine. 40 million that was allocated
7 earlier this year before the recent shortage.

8 On the other hand, Project BioShield passed by
9 Congress just this summer pushed by the Bush
10 Administration allocated 5.6 billion dollars for the next
11 ten years to develop vaccines and medications for anthrax,
12 smallpox and other biological agents.

13 Once again, we -- the government does have a dilemma
14 of how to deal with bioterrorism, how to deal with
15 missiles and how this drains from other health and
16 environmental priorities is just a highlight. Just
17 looking at the flu vaccine versus Project BioShield, once
18 again, 5.6 billion dollars. This is to develop another
19 smallpox vaccine after the smallpox vaccines that were
20 shipped out by CDC, many have been destroyed because they
21 weren't used.

22 In this context, we as citizens are going to react to
23 other programs that are -- that we're asked to look at,
24 quote, asked to look at.

25 Now, in the 1960's, physicians were asked to prepare

1 a response to the possibility that there would need to be
2 a medical response if there were a nuclear war. That was
3 something that PSR really got energized about and led to
4 the origins of Physicians for Social Responsibility.
5 Studies were published based upon data gathered from
6 Hiroshima and Nagasaki. And it was concluded that nuclear
7 war could very well bring on the final epidemic.

8 So how do you prepare for nuclear war? What would be
9 the environmental impact of such an event? I believe that
10 the BMDS escalates the arms race and will not make us any
11 safer. We need to utilize non-weapon system approaches to
12 try to accomplish the goal, if our goal is really making
13 our world safer.

14 Thank you.

15 MR. BONNER: Are there other folks who would like to
16 speak? If you'd like to sit there, that is fine. You can
17 stay there. Just give us your name.

18 CHARLOTTE DEFTEREOS: I'm Charlotte Deftereos and I
19 agree with everything my husband, Pallo Deftereos, said.

20 Now that I have a chance to speak, it's going to
21 be, I promise you, real short. This lady here suggested
22 something that I've been thinking a long time and that was
23 the use of the Marshall Plan.

24 Can you imagine what the chain reaction to the
25 Marshall Plan by a number of countries would be?

1 That is all I think I've got to say.

2 MR. BONNER: Thank you.

3 SHAUNA SMITH: Hi. I'm Shauna Smith. I'm with the
4 Physicians for Social Responsibility and Therapists for
5 Social Responsibility. I want to know if it's possible to
6 get a tape of the comments that have been spoken today?

7 MR. BONNER: I don't know that we'll have a tape but
8 we'll have a tape of the comments. I believe it will be
9 available -- I believe if you can put a checkmark next to
10 your name or send us an email, we'll get that to you.

11 Thank you.

12 UNIDENTIFIED SPEAKER: I have already spoken but I
13 wanted to ask a question. I'll try to be brief. I wanted
14 to address a question to you, sir, and your associates.

15 Will you pledge to advocate for increasing the number
16 of hearings and public, you know, opportunities for public
17 input on this environmental impact report?

18 MR. BONNER: Marty, you want to speak to that?

19 MR. DUKE: I mean, we've looked at --

20 UNIDENTIFIED SPEAKER: Who is "we"?

21 MR. DUKE: I say myself. We are trying to publicize
22 this. We have the website and try to make comments
23 because it's really impossible to go to all of the sites
24 we need to go to. And we try to give the avenues for
25 people to have an opportunity through the website, through

1 public forums, through email, faxes to make their case
2 known to the Programmatic EIS.

3 CAROLINE SCHMIDT: Why Sacramento? Why was
4 Sacramento picked?

5 KAREN BLOMQUIST: You missed 3,000 miles of country
6 between Arlington and Sacramento.

7 MR. DUKE: We looked at the states where we have a
8 lot of the MDS program and the Capitol.

9 KAREN BLOMQUIST: That is not good enough. You'll be
10 hearing from Europe because of it not just of the U.S. It
11 will never be good enough. No matter how you sugarcoat
12 it, it ain't good enough.

13 MR. BONNER: Any other comments?

14 ROD MACDONALD: You know, I -- I really find it just
15 stunning that something this national importance -- I
16 heard about it because somebody called in on a local radio
17 show and started talking about it and I -- what? What am
18 I hearing in the midst of traffic? I put it on my
19 calendar. I don't really have time as a scientist to
20 study all of this. I find it just stunning that this much
21 impact or -- you know, your adequate four times we've done
22 it. But what publicity? The Bee isn't here. We know how
23 to turn people out for Staples Stadium. We can sell the
24 world. We can't -- I find it stunning by the lack -- how
25 it's under-publicized.

1 Now we've done it. We have gone through the
2 formality. Give us an email and website. That is nice.
3 But the organic standards, where they try to ruin organic
4 standards, sewage waste and stuff like that. The
5 government got more feedback than it has ever gotten on a
6 single issue before.

7 PALLO DEFTEREOS: This is such a tremendous issue. I
8 just don't -- I've been studying it, as I said, for 60
9 years. I was in World War II. And I studied foreign
10 affairs before the war started. And with an issue of this
11 size, what is the big hurry? I mean, these kinds of
12 hearings should be had -- should be had all over the
13 country. I just don't understand it.

14 MR. BONNER: Thank you.

15 SHAUNA SMITH: I just would like to ask, do you
16 actually have any power to make any of these -- I don't
17 think we should actually be harassing you guys. You don't
18 really have the power to make the decisions, do you?

19 MR. DUKE: Our point is to try to assess the impact
20 of BMDS on the environment, to provide opportunities and
21 very spirited comments, heartfelt comments that you have
22 provided for us on the record and try to address those.

23 SHAUNA SMITH: But if we wanted more meetings, you
24 couldn't make it happen anyway, right?

25 MR. DUKE: We'd have to look it --

1 SHAUNA SMITH: But you, personally --

2 MR. DUKE: -- or the political impacts --

3 SHAUNA SMITH: You, personally, could you do
4 anything?

5 MR. DUKE: I would have to go back, go with the heart
6 of leadership.

7 SHAUNA SMITH: We'd appreciate it if there was any
8 chance.

9 MR. DUKE: Again, I appreciate you all coming out.
10 Like you said, a lot of you came out after a hard day's
11 work to provide the comments. And we all know these are
12 very sincere comments. We'll take the comments and go
13 back and look at them and address them in the EIS.

14 I appreciate you all coming out and providing your
15 comments.

16 Thank you.

17 (The proceedings concluded at 9:43 p.m.)

1 CERTIFICATE
2 OF
3 CERTIFIED SHORTHAND REPORTER
4

5 The undersigned certified shorthand reporter of the
6 state of California does hereby certify:

7 That the foregoing deposition was taken before me at
8 the time and place therein set forth, at which time the
9 witness was duly sworn by me;

10 That the testimony of the witness and all objections
11 made at the time of the deposition were recorded
12 stenographically by me and thereafter transcribed, said
13 transcript being a true copy of my shorthand notes
14 thereof.

15 In witness whereof, I have subscribed my name this
16 date_____.
